TABLE OF CONTENTS

LIST OF TABLES

1. SCOPE

The EO_DATA_HANDLING Software User Manual provides:

- a detailed description of usage of the CFI functions included within the EO_DATA_HANDLING CFI software library.
- The format description of the Earth Observation Missions files as well as the available versions of those files.

2. ACRONYMS, NOMENCLATURE AND TERMINOLOGY

2.2. Nomenclature

CFI A group of CFI functions, and related software and documentation. that will be distributed by ESA to the users as an independent unit

CFI function A single function within a CFI that can be called by the user

Library A software library containing all the CFI functions included within a CFI plus the supporting functions used by those CFI functions (transparently to the user)

2.3.Note on Terminology

In order to keep compatibility with legacy CFI libraries, the Earth Observation Mission CFI Software makes use of terms that are linked with missions already or soon in the operational phase like the Earth Explorers.

This may be reflected in the rest of the document when examples of Mission CFI Software usage are proposed or description of Mission Files is given.

4. INTRODUCTION

4.1.Functions Overview

This software library contains a set of functions for reading and writing Earth Observation Mission Files. The following CFI functions are included:

4.1.1.Reading routines

- **xd_read_fhr:** reads the fixed header for an Earth Observation XML file.
- **xd_read_bulletin:** reads the time correlations from an IERS bulletin.
- **xd_read_orbit_file**: reads orbit files consisting in a list of state vectors of the satellite in the orbit. The following files are supported: Predicted Orbit files, Restituted Orbit files and DORIS Preliminary files.
- **xd_read_doris**: reads DORIS Navigator files for CRYOSAT.
- **xd_read_doris_header:** reads the MPH and SPH data from a DORIS Navigator file for CRYOSAT.
- **xd_read_osf**: reads Orbit Scenario files.
- **xd_read_att:** reads a generic attitude file.
- **xd_read_star_tracker:** reads an star traker file for CRYOSAT.
- **xd_read_star_tracker_conf_file:** reads an star tracker configuration file for CRYOSAT.
- **xd_read_dem:** provides the points of a DEM that are adjacent to a given point.
- **xd_read_dem_config_file:** reads a DEM configuration file.
- **xd_read_sdf**: reads swath definition files.
- **xd_read_stf:** reads swath template files.
- **xd_read_stf_vhr:** reads the variable header for swath template files
- **xd_read_zone:** reads the parameters of one zone in a zone database file.
- **xd_read_zone_file:** reads a zone database file.
- **xd_read_zone_id:** reads the list of zone names from a zone database file.
- **xd_read_station:** reads the parameters of one station in a station database file.
- **xd_read_station_file:** reads a station database file.
- **xd_read_station_id:** reads the list of station names from a station database file
- **xd_read_star:** reads the parameters of one star in a star database file.
- **xd_read_star_file:** reads a star database file.
- **xd_read_star_id:** reads the list of star id. from a star database file
- **xd_read_tle:** reads a TLE file

- **xd_read_precise_propag_file:** reads a data file used to configure the numerical propagator

4.1.2.Writing routines

- **xd_write_orbit_file**: writes an orbit file using as input an structure with the data of the file
- **xd_write_osf**: writes an orbit scenario file using as input an structure with the data of the file
- **xd_write_doris:** writes a DORIS Navigator file.
- **xd_write_att:** writes a generic attitude file.
- **xd_write_stf**: writes a swath template file using as input the data structure containing the data for the swath.
- **xd_write_tle**: writes a TLE file using as input a data structure.

4.1.3.Functions to free memory

- **xd_free_orbit**: frees the memory allocated during the reading function **xd_read_orbit_file**.
- **xd_free_doris**: frees the memory allocated during the reading function **xd_read_doris**
- **xd_free_osf**: frees the memory allocated during the reading function **xd_read_osf**.
- **xd_free_sdf**: frees the memory allocated during the reading function **xd_read_sdf**.
- **xd_free_stf**: frees the memory allocated during the reading function **xd_read_stf**.
- **xd_free_stf_vhr**: frees the memory allocated during the reading function **xd_read_stf_vhr**.
- **xd_free_att**: frees the memory allocated during the reading function **xd_read_att**.
- **xd_free_star_tracker**: frees the memory allocated during the reading function
- xd_read_star_tracker.
- **xd_free_dem**: frees the memory allocated in the reading function **xd_read_dem**
- **xd_free_zone**: frees the memory allocated during the reading function **xd_read_zone**.
- **xd_free_zone_file**: rees the memory allocated during the reading function **xd_read_zone_file**.
- **xd_free_zone_id**: frees the memory allocated during the reading function **xd_read_zone_id**.
- **xd_free_station_file**: frees the memory allocated during the reading function
- xd_read_station_file.
- **xd_free_station_id**: frees the memory allocated during the reading function **xd_read_station_id**.

4.1.4.Validation of XML files

- **xd_xml_validate**: validates an XML file using an XML schema as reference.
- **xd_select_schema**: it returns the most recent schema name supported for a given file type and mission

4.2.Reading and writing files

When reading files, the user should be aware that:

- Many of the structures used for reading files contain dynamic data that is allocated within the reading function. In these cases, the memory has to be freed when it is not going to be used any more by calling the suitable function.
- The reading functions for each of the file types, does not read the fixed header. The fixed header could be read independently using the CFI function **xd_read_fhr**.
- When reading the fixed header with **xd_read_fhr**, the schema name is not read (the "schema" element in the output structure **xd_fhr** will be set to "_NOSCHEMA_") . If required, the schema name and version should be read independently with the CFI functions in explorer_file_handling.

When writing files, the user should be aware that:

- The schema name and version can be written in the file in the following ways:
  - Setting the schema name in the "schema" element in the **xd_fhr** structure. When calling the **xd_write_*xxx*** function, the schema name and version will be written in the file. Note that if the schema name is set to "_NOSCHEMA_", the schema attributes will no be written in the file.
  - After writing the file, by calling the function **xf_set_schema** (in explorer_file_handling). Note that the CFI function **xd_select_schema** allows to get the default schema name with which the file to be written is compliant.

5. LIBRARY INSTALLATION

For a detailed description of the installation of any CFI library, please refer to [GEN_SUM].

6. LIBRARY USAGE

Note that to use the EO_DATA_HANDLING software library, the following other CFI software libraries are required:

- EO_FILE_HANDLING (See [F_H_SUM]).

It is needed to have properly installed in the system the following external libraries:

- LIBXML2 (MIT license,see [GEN_SUM]), and the
- POSIX thread library:libpthread.so (pthread.lib for WINDOWS, with license LGPL)

To use the EO_DATA_HANDLING software library in a user application, that application must include in its source code:

- explorer_data_handling.h (for a C application)

To link correctly this application, the user must include in his linking command flags like (assuming *cfi_lib_dir* and *cfi_include_dir* are the directories where respectively all CFI libraries and include files have been installed, see [GEN_SUM] for installation procedures):

- SOLARIS/LINUX:

  -I*cfi_include_dir* -L*cfi_lib_dir* -lexplorer_data_handling

  -lexplorer_file_handling -lxml2 –lpthread

- WINDOWS:

  /I *"cfi_include_dir"* /libpath:*"cfi_lib_dir*" libexplorer_data_handling.lib libexplorer_file_handling.lib libxml2.lib pthread.lib

- MacOS:

  -I*cfi_include_dir* -L*cfi_lib_dir* -lexplorer_data_handling

  -lexplorer_file_handling -lpthread

  -framework libxml -framework libiconv

All functions described in this document have a name starting with the prefix `xd_`

To avoid problems in linking a user application with the `EO_DATA_HANDLING` software library due to the existence of names multiple defined, the user application should avoid naming any global software item beginning with either the prefix `XD_` or `xd_`.

Finally, in order to use the function **xd_xml_validate** or its equivalent executable program **xml_validator**, it is neccessary the xerces-c 2.7 (or later) dynamic library and the SAX2Count executable program. Both of them are distributed under Apache 2.0 Licence (More information about xerces-c can be found in: http://xml.apache.org/xerces-c/index.html).

Both, **xd_xml_validate** and **xml_validator** internally calls the SAX2Count program, so that in order to find it, the path for SAX2Count and the xerces-c dynamic library has to be included in the environment variable PATH (For LINUX and SOLARIS, the xerces library has to be included in the LD_LIBRARY_PATH instead).

It is possible to call the following CFI functions from a user application.

Table 1: CFI functions included within EO_DATA_HANDLING library

Error Handling Functions		
xd_verbose	not applicable	
xd_silent		
xd_get_code		
xd_get_msg		
xd_print_msg		

Notes about the table:

- To transform the extended status flag returned by a CFI function to either a list of error codes or a list of error messages, the enumeration value (or the corresponding long value) described in the table must be used
- The error handling functions have no enumerated values

Whenever available it is strongly recommended to use enumeration values rather than integer values.

6.1. Usage hints

Every CFI function has a different length of the Error Vector, used in the calling I/F examples of this SUM and defined at the beginning of the library header file. In order to provide the user with a single value that could be used as Error Vector length for every function, a generic value has been defined (XD_ERR_VECTOR_MAX_LENGTH) as the maximum of all the Error Vector lengths. This value can therefore be safely used for every call of functions of this library.

6.2. General Enumerations

The aim of the current section is to present the enumeration values that can be used rather than integer parameters for some of the input parameters of the EO_DATA_HANDLING routines, as shown in the table below. The enumerations presented in [GEN_SUM] are also applicable.

	GLOBE/ACE data warped using combined altimetry (only above 60°N)	XD_DEM_ACE2_SOURCE_SRTM_GLOBE	5
	Pure altimetry data (derived from ERS-1 Geodetic Mission, ERS-2 and EnviSat data using Delaunay Triangulation and Bilinear interpolation)	XD_DEM_ACE2_SOURCE_SRTM_ALT	6

The use of the previous enumeration values could be restricted by the particular usage within the different CFI functions. The actual range to be used is indicated within a dedicated reference named ***allowed range***. When there are not restrictions to be mentioned, the allowed range column is populated with the label ***complete***.

6.3.Data Structures

The aim of this section is to present the data structures that are used in the EO_DATA_HANDLING library. These structures are used as output/inputs in the reading/writing routines. The following table show the data structures with their names and the data that contains:

7. CFI FUNCTIONS DESCRIPTION

The following sections describe each CFI function. The calling interfaces are described for C.

Input and output parameters of each CFI function are described in tables, where C programming language syntax is used to specify:

- Parameter types (e.g. long, double)
- Array sizes of N elements (e.g. param[N])
- Array element M (e.g. [M])

7.1.xd_read_fhr

7.1.1.Overview

The **xd_read_fhr** CFI function reads the fixed header for Earth ExplorerObservation XML files.

7.1.2.Calling interface

The calling interface of the **xd_read_fhr** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      char *file_name;
      xd_fhr fhr;
      long ierr[XD_NUM_ERR_READ_FHR];
      status = xd_read_fhr(file_name, &fhr, ierr);
}
```

7.1.3.Input parameters

The **xd_read_fhr** CFI function has the following input parameters:

Table 4: Input parameters of xd_read_fhr function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
file_name	char*	-	file name	-	-

7.1.4.Output parameters

The output parameters of the **xd_read_orbit_file** CFI function are:

Table 5: Output parameters of xd_read_fhr function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_fhr	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-
Fixed header data	xd_fhr	-	Data structure containing the data read from the fixed header	-	-
ierr	long[]	-	Error vector	-	-

7.1.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_fhr** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EOXPLORER_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_fhr** function by calling the function of the EOXPLORER_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

Table 6: Error messages of xd_read_fhr function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Could not open the file	No calculation performed	XD_CFI_READ_FHR_OPEN_FILE_ERR	0
ERR	Error reading the fixed header	No calculation performed	XD_CFI_READ_FHR_GET_FIXED_HEADER_ERR	1
ERR	Error closing the file	No calculation performed	XD_CFI_READ_FHR_CLOSE_FILE_ERR	2

7.1.6.Runtime performances

The following runtime performances have been measured.

Solaris 32-bit. [ms]	Solaris 64 bit. [ms]	Linux 32-bit. [ms]	Linux 64-bit. [ms]
2.1	1.0	1.8	0.4

7.2.xd_read_bulletin

7.2.1.Overview

The **xd_read_bulletin** CFI function reads IERS bulletin files and returns the data relevant for time correlations. Either version 1980 as version 2010 of the IERS bulletins can be read.

7.2.2.Calling interface

The calling interface of the **xd_read_bulletin** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      char *bulb_file;
      xd_iers_bulletin_b iers_data
      long ierr[XD_NUM_ERR_READ_BULLETIN];
      status = xd_read_bulletin (bulb_file, &iers_data, ierr);
}
```

7.2.3.Input parameters

The **xd_read_bulletin** CFI function has the following input parameters:

Table 8: Input parameters of xd_read_bulletin function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
bulb_file	char*	-	File name	-	-

7.2.4.Output parameters

The output parameters of the **xd_read_bulletin** CFI function are:

Table 9: Output parameters of xd_read_bulletin function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_bulletin	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-

IERS bulletin data	xd_iers_bulletin_b	-	Data structure containing the data read from the file	-	-
ierr	long[]	-	Error vector	-	-

7.2.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_bulletin** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_bulletin** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

Table 10: Error messages of xd_read_bulletin function

Error type	Error message	Cause and impact	Error code	Error No
ERR	File does not exist	No calculation performed	XD_CFI_READ_BULLETIN_FILE_ERR	0
ERR	Time table is empty or has wrong format	No calculation performed	XD_CFI_READ_BULLETIN_TABLE_ERR	1
ERR	File is not recognized	No calculation performed	XD_CFI_READ_BULLETIN_FILE_RECOG_ERR	2

7.2.6.Runtime performances

The following runtime performances have been measured.

Table 11: Runtime performances of xd_read_bulletin function

Solaris 32-bit. [ms]	Solaris 64 bit. [ms]	Linux 32-bit. [ms]	Linux 64-bit. [ms]
21.8	6.3	16.1	2.8

7.3.xd_read_orbit_file

7.3.1.Overview

The **xd_read_orbit_file** CFI function reads orbit files for Earth Observation Missions. The files have to be written in XML and consist on a list of state vectors of the satellite along the orbit.

This function can also be used for reading the list of state vectors within Orbit Event files.

7.3.2.Calling interface

The calling interface of the **xd_read_orbit_file** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      char *file_name;
      long read_fro_flag, time_orbit_flag, time_ref, reading_osv_flag;
      double start_range, stop_range;
      xd_orbit_file orbit_data
      long ierr[XD_NUM_ERR_READ_ORBIT_FILE];
      status = xd_read_orbit_file (file_name, &read_fro_flag,
                                   &time_orbit_flag, &time_ref,
                                   &start_range, &stop_range,
                                   &reading_osv_flag,
                                   &orbit_data, ierr);
}
```

7.3.3.Input parameters

The **xd_read_orbit_file** CFI function has the following input parameters:

Table 12: Input parameters of xd_read_orbit_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
file_name	char*	-	Orbit file name	-	-
read_fro_flag	long*	-	flag to indicate if the input file is: • a predicted orbit file • a restituted orbit file or a DORIS Preliminary file		• XD_TRUE for ROF and DORIS files • XD_FALSE for POF files

time_orbit_flag	long*	-	Flag for selecting the time range of the initialisation. Select either: • XD_SEL_FILE: for reading the whole file • XD_SEL_ORBIT: for reading the interval given by the start_range and the stop range parameters in orbits • XD_SEL_TIME: for reading the interval given by the start_range and the stop range parameters in days	-	All
time_ref	long*	-	Time reference if time_orbit_flag is XD_SEL_TIME. Dummy otherwise.	-	-
reading_osv_flag	long*	-	flag to indicate if the state vectors data have to be read.	-	• XD_TRUE for reading the state vector data • XD_FALSE for reading just the times and orbit numbers
start_range	double*	-	Start orbit or day	orbits or days	-
stop_range	double*	-	Stop orbit or day	orbits or days	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time model ID: time_model. See [GEN_SUM].
- Time reference ID: time_ref. See [GEN_SUM].
- Time range initialisation flag: time_orbit_flag. See current document, section 6.2

7.3.4.Output parameters

The output parameters of the **xd_read_orbit_file** CFI function are:

Table 13: Output parameters of xd_read_orbit_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_orbit_file	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-

orbit_data	xd_orbit_file	-	Data structure containing the data read from the file	-	-
ierr	long[]	-	Error vector	-	-

Memory Management: The *orbit_data* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd_free_orbit_file**

7.3.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_orbit_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_orbit_file** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

Table 14: Error messages of xd_read_orbit_file function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Error in reading file	No calculation performed	XD_CFI_READ_ORBIT_FILE_READ_ERR	0
ERR	Error in getting the first element inside the input range	No calculation performed	XD_CFI_READ_ORBIT_FILE_INPUT_RANGE_ERR	1
ERR	Error allocating memory	No calculation performed	XD_CFI_READ_ORBIT_FILE_MEMORY_ERR	2
ERR	Internal Error # 1	No calculation performed	XD_CFI_READ_ORBIT_FILE_INTERNAL_1_ERR	3
ERR	Error while reading data	No calculation performed	XD_CFI_READ_ORBIT_FILE_DATA_READ_ERR	4
ERR	Gap found after OSV no. %li	No calculation performed	XD_CFI_READ_ORBIT_FILE_GAP_ERR	5

7.3.6.Runtime performances

The following runtime performances have been measured.

Table 15: Runtime performances of xd_read_orbit_file function

7.4.2.Calling interface

The calling interface of the **xd_free_orbit_file** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
     xd_orbit_file orbit_data xd_free_orbit_file (&orbit_data);
}
```

7.4.3.Input parameters

The **xd_free_orbit_file** CFI function has the following input parameters:

Table 16: Input parameters of xd_free_orbit_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
orbit_data	xd_orbit_file	-	Orbit data structure	-	-

7.4.4.Output parameters

This function does not return any value nor parameters.

7.5.xd_read_doris

7.5.1.Overview

The **xd_read_doris** CFI function reads DORIS Navigator files for Cryosat.

7.5.2.Calling interface

The calling interface of the **xd_read_doris** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status;
      char *doris_file;
      long time_mode, interpol_flag;
      double time0, time1;
      xd_doris_file doris_data
      long ierr[XD_NUM_ERR_READ_DORIS];

      status = xd_read_doris(doris_file, &time_mode,
                             &time0, &time1,
                             &interpol_flag,
                             &doris_data, ierr);
}
```

7.5.3.Input parameters

The **xd_read_doris** CFI function has the following input parameters:

Table 17: Input parameters of xd_read_doris function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
doris_file	char*	-	DORIS Navigator file name	-	-
time_mode	long	-	Flag for reading the whole file or just the requested time window	-	• XD_SEL_FILE • XD_SEL_TIME
time0	double	-	Start time for the requested time window (if XD_SEL_TIME selected)	days in UTC	-
time1	double	-	Stop time for the requested time window (if XD_SEL_TIME selected)	days in UTC	-

interpol_flag	long	-	Flag to indicate if the read data are used for interpolation purposes. In that case 4 extra state vectors are read out of the	-	• XD_TRUE for interpol data • XD_FALSE otherwise

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time model ID: time_mode. See [GEN_SUM].

7.5.4. Output parameters

The output parameters of the **xd_read_doris** CFI function are:

Table 18: Output parameters of xd_read_doris function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_doris	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-
doris_data	xd_doris_file	-	DORIS data	-	-

7.7.xd_read_doris_header

7.7.1.Overview

The **xd_read_doris_header** CFI function reads the Main Product Header (MPH) and the Specific Product Header (SPH) from DORIS Navigator files for Cryosat.

7.7.2.Calling interface

The calling interface of the **xd_read_doris_header** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status;
      char *doris_file;

7.13.xd_free_stf

7.13.1.Overview

The **xd_free_stf** CFI function frees the memory allocated during the reading function **xd_read_stf**.

7.13.2.Calling interface

The calling interface of the **xd_free_stf** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      xd_stf_file stf_data xd_free_stf (&stf_data);
}
```

7.13.3.Input parameters

The **xd_free_stf** CFI function has the following input parameters:

Table 40: Input parameters of xd_free_stf function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
stf_data	xd_stf_file	-	STF data structure	-	-

7.13.4.Output parameters

This function does not return any value nor parameters.

7.14.xd_read_stf_vhr

7.14.1.Overview

The **xd_read_stf_vhr** CFI function reads the variable header in Swath Template File for Earth Observation Missions.

7.14.2.Calling interface

The calling interface of the **xd_read_stf_vhr** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status;
      char *file_name;
      xd_stf_vhr vhr_data;
      long ierr[XD_NUM_ERR_READ_STF_VHR];

      status = xd_read_stf_vhr (file_name, &vhr_data, ierr);
}
```

7.14.3.Input parameters

The **xd_read_stf_vhr** CFI function has the following input parameters:

Table 41: Input parameters of xd_read_stf_vhr function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
file_name	char*^	-	Swath Template file name	-	-

7.14.4.Output parameters

The output parameters of the **xd_read_stf_vhr** CFI function are:

Table 42: Output parameters of xd_read_stf_vhr function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range

vhr_data	xd_stf_vhr	-	Data structure for the Swath template variable header	-	-
ierr	long[]	-	Error vector	-	-

Memory Management: The *vhr_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd_free_stf_vhr**.

7.14.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_stf_vhr** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_stf_vhr** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

7.23.xd_read_dem_config_file

7.23.1.Overview

The **xd_read_dem_config_file** CFI function reads DEM configuration parameters. These parameters are described in section 9.12. Note that the DEM version (1 or 2) is automatically detected (See [MCD] for further details about the DEM models).

7.23.2.Calling interface

The calling interface of the **xd_read_dem_config_file** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status;
      char *file_name;
      xd_dem_config_file dem_config_data;
      long ierr[XD_NUM_ERR_READ_DEM_CONFIG];

      status = xd_read_dem_config_file (file_name,
                                        &dem_config_data,
                                        ierr);
}
```

7.23.3.Input parameters

The **xd_read_dem_config_file** CFI function has the following input parameters:

Table 65: Input parameters of xd_read_dem_config_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
file_name	char*	-	DEM configuration file name	-	-

7.23.4.Output parameters

The output parameters of the **xd_read_dem_config_file** CFI function are:

Table 66: Output parameters of xd_read_dem_config_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_dem_config_file	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-
dem_config_data	xd_dem_config_file	-	DEM configuration data structure	-	-
ierr	long[]	-	Error vector	-	-

7.23.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_dem_config_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_dem_config_file** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

7.24. xd_read_zone

7.24.1.Overview

The **xd_read_zone** CFI function reads a specific zone from a zone database file for Earth Observation Missions.

7.24.2.Calling interface

The calling interface of the **xd_read_zone** CFI function is the following (input parameters are underlined)

```
#include <explorer_data_handling.h>
{
      long status; char *zone_id; char *file_name;
      xd_zone_rec zone_rec;
      long ierr[XD_NUM_ERR_READ_ZONE];

      status = xd_read_zone (file_name, &zone_id, &zone_rec, ierr);
}
```

7.24.3.Input parameters

The **xd_read_zone** CFI function has the following input parameters:

Table 68: Input parameters of xd_read_zone function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
file_name	char*	-	Zone database file name	-	-
zone_id	char*	-	Zone Id to be read	-	-

7.24.4.Output parameters

The output parameters of the **xd_read_zone** CFI function are:

Table 69: Output parameters of xd_read_zone function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_zone	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-
zone_rec	xd_zone_rec	-	Zone Data structure	-	-
ierr	long[]	-	Error vector	-	-

Memory Management: The *zone_rec* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd_free_zone**.

7.24.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_zone** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_zone** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

7.25.xd_free_zone

7.25.1.Overview

The **xd_free_zone** CFI function frees the memory allocated during the reading function **xd_read_zone**.

7.25.2.Calling interface

The calling interface of the **xd_free_zone** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      xd_zone_rec zone_data;
      xd_free_zone (&zone_data);

7.25.4.Output parameters

This function does not return any value nor parameters.

7.26. xd_read_zone_file

7.26.1.Overview

The **xd_read_zone_file** CFI function reads a zone database file for Earth Observation Missions.

7.26.2.Calling interface

The calling interface of the **xd_read_zone_file** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>

7.27. xd_free_zone_file

7.27.1.Overview

The **xd_free_zone_file** CFI function frees the memory allocated during the reading function xd_read_zone_file.

7.27.2.Calling interface

The calling interface of the **xd_free_zone_file** CFI function is the following (input parameters are under-lined):

```
#include <explorer_data_handling.h>
{
      xd_zone_file zone_data;
      xd_free_zone_file (&zone_data);
}
```

This function does not return any value nor parameters.

7.28.xd_read_zone_id

7.28.1.Overview

The **xd_read_zone_id** CFI function reads the list of zone names (Id) in a zone database file for Earth Observation Missions.

7.28.2.Calling interface

The calling interface of the **xd_read_zone_id** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status, num_zones;
      char *file_name;

7.30.xd_read_station

7.30.1.Overview

The **xd_read_station** CFI function reads the data of a station from a station database file.

7.30.2.Calling interface

The calling interface of the **xd_read_station** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>

7.33.3.Input parameters

The **xd_read_station_id** CFI function has the following input parameters:

Table 92: Input parameters of xd_read_station_id function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
file_name	char*	-	Station database file name	-	-

7.33.4.Output parameters

The output parameters of the **xd_read_station_id** CFI function are:

Table 93: Output parameters of xd_read_station_id function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xd_read_station_id	long	-	Function status flag: • = 0 No error • > 0 Warnings, results generated • < 0 Error, no results generated	-	-
num_stations	long	-	Number of stations	-	-
station_list	char**	.	Station list name	-	-
ierr	long[]	-	Error vector	-	-

Memory Management: The *station_list* is a double pointer to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data is not to be used any more. The memory can be freed by calling to the CFI function **xd_free_station_id**.

7.33.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_read_station_id** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_read_station_id** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

7.41. xd_write_orbit_file

7.41.1.Overview

The **xd_write_orbit_file** CFI function writes an orbit file in XML format using the data structure provided by the user. The orbit file can be either:

- A Predicted orbit file
- A Restituted orbit file
- A DORIS Predicted file
- The Time_Reference and Ref_Frame fields in the variable header of the orbit file are filled according to the parameters time_ref_of and ref_frame in the OSV records. Therefore it is required that all OSVs contained in xd_orbit_file have the same time reference and reference frame.

7.41.2.Calling interface

The calling interface of the **xd_write_orbit_file** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>

7.42.5.Warnings and errors

Next table lists the possible error messages that can be returned by the **xd_write_osf** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_DATA_HANDLING software library **xd_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (`WARN`) or an error (`ERR`), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd_write_osf** function by calling the function of the EO_DATA_HANDLING software library **xd_get_code** (see [GEN_SUM])

7.43.xd_write_doris

7.43.1.Overview

The **xd_write_doris** CFI function writes a DORIS NAVIGATOR Product file for CRYOSAT, using the data provided by the user.

7.43.2.Calling interface

The calling interface of the **xd_write_doris** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status;
      char *file_name;

7.44.xd_write_stf

7.44.1.Overview

The **xd_write_stf** CFI function writes a swath template file XML format using the data provided by the user.

7.44.2.Calling interface

The calling interface of the **xd_write_stf** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status;

7.46.xd_write_tle

7.46.1.Overview

The **xd_write_tle** CFI function writes a TLE file. The data to be written are in the input structure except for the checksum, that it is computed for every line.

7.46.2.Calling interface

The calling interface of the **xd_write_tle** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{

7.47.xd_xml_validate

7.47.1.Overview

The **xd_xml_validate** CFI function validates an XML file using its XML schema and checks the XML schema versioning.

7.47.2.Calling interface

The calling interface of the CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      long status, valid_status;
      char *filename, *schema, *logfile;
      long mode;

      status = xd_xml_validate (filename, &mode, schema, logfile,
                                &valid_status, ierr);
}
```

7.47.3.Input parameters

The **xd_xml_validate** CFI function has the following input parameters:

Table 142: Input parameters of xd_xml_validate function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
filename	char*	-	File name to validate	-	-
mode	long	-	Flag to select the schema to be used to validate the file. It can be either: • XD_DEFAULT_SCHEMA: use the schema that is in the root element of the XML file. or • XD_USER_SCHEMA: use the schema given in the *schema* parameter in the interface.	-	-
schema	char*	-	Schema file. The schema can be given as an absolute path or as a relative path from the file's directory (No the current directory)	-	-

logfile	char*	-	Log file (file path). It is used to store the messages returned by the validation process. The result of the validation can be seen at the end of the log in the following message:	-	-

7.47.7.Executable program

An XML file can also be validated using the executable program **xml_validate.** It can be called from a Unix shell as:

xml_validate -file filename

[**-sch** schema_filename] [**-log** log_filename]

[-help] [-v]

[-show]

Note that:

- Order of parameters does not matter.
- Bracketed parameters are not mandatory.
- [-v] option for Verbose mode (default is Silent).
- [-show] displays the inputs of the function and the results.
- The filename is validated using the schema_filename if it is provided. If not, the default schema is used (the one in the root element of the file).
- The validation log is stored in the log_filename. By default the standard output is used.

Example:

xml_validate **-file** ../../data/CRYOSAT_XML_OSF

-sch ../../../../schemas/public/CS_OPER_MPL_ORBSCT_01.00.XSD

-log log_file_exe **-show**

7.48.xd_select_schema

7.48.1.Overview

The **xd_select_schema** returns the most recent schema file name applicable for a given file type and mission.

7.48.2.Calling interface

The calling interface of the CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
      xd_fileinfo info;
      char        schema[XD_MAX_STR];
      long        ierr[XD_NUM_ERR_SELECT_SCHEMA];

      status = xd_select_schema(&info, schema,
                                ierr);
}
```

8. LIST OF SCHEMA'S VERSIONS

Next table shows the list of last version (default version) for the schema of the XML files that are handled by the CFI. The default schema depends on the mission, so different versions appear depending on the Mission Columt. For the sake of simplicity, in this column could appear:

- Sat_1: All satellites except SENTINEL missions.
- Sat_2: SENTINEL missions.

However the current CFI libraries are able to use older XML file versions. Next table shows all the available schema's versions for the Earth Observation Missions files at the time of the CFI's package delivery, and which of them are supported by the current CFI's implementation.

The meaning of the column “Supp. CFI's” is:

- N: Version not supported for reading/writing.
- Y: Supported version for reading and writing.
- R: Supported only for reading.

Note that the writing functions create files with the version labeled with “Y”.

Note also that for those files that can be written by the CFI, the written version depend on the satellite mission (For reading, the files can be read independently of the mission).

For consulting the format of these files in their last version see section 9. For older versions, the format can be consulted through the schema.

In the CFI's installation packages schemas and example files are included (under *files* directory, see [GEN_SUM]).

9. FILES FORMAT SPECIFICATION

This section presents the formats for all the files used by the Earth Observation CFI software. These formats correspond to the last schema versions indicated in section 8.

The files used by the CFI can be:

- External: Files generated and/or used for the CFI software and other external facilities.
- Internal: Files used only in the CFI for configuration purposes.

All internal files are written in ASCII, with XML syntax. Following the usual format for the Earth Observation Files, the file contains both:

- A header: It is divided in a fixed header and optionally a variable header. The format for the fixed header is common to all Earth Observation Files and can be seen in [EE_FMT].
- A data block containing the input/output data of the functions.
- The general structure for a file will be:

```
<?xml version = "1.0" encoding = "UTF-8"?>
<Earth_Explorer_File>
   <Earth_Explorer_Header>
      <Fixed_Header>
      ...
      </Fixed_Header>
      <Variable_Header>
      ...
      </Variable_Header>
   </Earth_Explorer_Header>

   <Data_Block type="xml">
   ...
   </Data_Block type>

</Earth_Explorer_File>
```

9.1.Fixed Header

9.1.1.Format

The Fixed Header is an XML structure. Many of its fields are redundant with the File Name elements, but are present in more readable form in the Fixed Header, whereas in File Name they are more compact for obvious reasons. Its format is described in the followig tables:

Table 151: Fixed Header Structure

Tag name	type	Attribute	C Format	Description
File_Name	string	-	%s	It is a repetition of the Logical File Name, i.e. the File Names excluding the extension. This allows this field to be independent from the storage in 1 complete file or 2 separate files for Header and Data Block
File_Description	string	-	%s	A 1-line description of the File Type. Each Mission shall define the list of official file descriptions (per File Type).
Notes	string	-	%s	Multi-lines free text. This can be used for any type of comment, relevant that instance of the file.
Mission	string	-	%s	A 1-word description of the Mission, coherent with the Mission element in the File Name. See [EE_FMT] Section 4.1.1 for the official list.
File_Class	string	-	%10s	A 1-line description of the file class, coherent with the File Class element in the File Name. Each Mission shall define the list of official file classes.
File_Type	string	-	%s	It is a repetition of the File Type element in the File Name.
Validity_Period	structure (see Table 152)	-	-	Structure containing the start-stop validity period of the file.
File_Version	integer	-	%04ld	It is a repetition of the File Version element in the File Name. Must start at 1 (not 0).
Source	structure (see Table 153)	-	-	Structure with information about the source of the file.

Table 152: Fixed Header. Validity Period

Tag name	type	Attribute	C Format	Description
Validity_Start	%23s	-	string	This is the UTC Validity Start Time, coherent with the Validity Start Time in the File Name, but in CCSDS ASCII format with time reference. Note that this can have the special value indicating “beginning of mission” (without an absolute time specified) as defined in [MCD]

Validity_Stop	%23s	-	string	This is the UTC Validity Stop Time, coherent with the Validity Stop Time in the File Name, but in CCSDS ASCII format with time reference. indicating “end of mission” (without an absolute time specified) as defined in [MCD].

Table 153: Fixed Header. Source

Tag name	type	Attribute	C Format	Description
System	string	-	%s	Name of the Ground Segment element creating the file (e.g. FOS, PDS, SSALTO...)
Creator	string	-	%s	Name of the tool, within the Ground Segment element, creating the file (e.g. CS-MCS, IPF1...)
Creator_Version	string	-	%s	Version of the tool (e.g. 1.0, 2.1a ...)
Creation_Date	string	-	%23s	This is the UTC Creation Date, in CCSDS ASCII format with time reference. This format is defined in [MCD].

9.2.Predicted Orbit files

9.2.1.Format

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section

2. Variable Header: It contains the information for of the reference frame of the state vectors in the file and the reference time for time recomputations. The format is in Table 154.

3. Data Block: It consists in a set of structures described in the tables below:

Table 154: Predicted Orbit File. Variable_Header

Tag name	type	Attribute	C Format	Description
Ref_Frame	string	-	%s	Reference frame for the state vectors in the file. It can be one of the following values: BAR_MEAN_2000 HEL_MEAN_2000 GEO_MEAN_2000 MEAN_DATE TRUE_DATE EARTH_FIXED BAR_MEAN_1950 QUASI_MEAN_DATE PSE_TRUE_DATE QUASI_TRUE_DATE
Time_Reference	String	-	%s	It is used as time reference when, due to an inconsistency with other time correlations, times associated to the state vector have to be recomputed. See xo_orbit_init_file in [ORBIT_SUM] for more details. It can be one of the following values: TAI UTC UT1

Note to Reference Frame: the main usage of the orbit library is to support geo-location. As a consequence an earth-fixed frame is the natural reference frame to use, end-to-end. In addition, the library has currently no support for injecting polar motion data which would allow to accurately convert between inertial and earth-fixed frames.

The recommended usage is to use orbit files with earth-fixed frame data (orbit state vectors) to initialise the orbit id, and to compute geo-location information in earth-fixed. This provides accurate computations. For any other usage the user should known what he is doing (and accept small inaccuracies).

NB:

- initialising the orbit id with inertial orbit data, and computing inertial parameters, is also supported and is accurate;

- initialising the orbit id with earth-fixed orbit data, and computing inertial parameters (or vice-cersa), leads to slightly inaccurate computations and should be avoided unless ignoring polar motion is acceptable

Table 156: Precicted Orbit File. OSV

Tag name	type	Attribute	C Format	Description
TAI	date		%s	TAI date and time of OSV, in ASCII standard time format, including time reference and micro-seconds
UTC	date		%s	UTC date and time of OSV, in ASCII standard time format, including time reference and micro-seconds
UT1	date		%s	UT1 date and time of OSV, in ASCII standard time format, including time reference and micro-seconds
Absolute_Orbit	integer		%+06ld	absolute orbit counter This counter is incremented by one unit from a record to the next. It must be dif- ferenciated with the real absolute orbit number on which the state vector really belongs i.e : if the Z value of the OSV is >= 0 then “real” absolute orbit number equal the absolute orbit counter if the Z value of the OSV is < 0 then “real” absolute orbit number equal the absolute orbit counter minus 1.
X	real	m	%+012.3lf	X position in earth-fixed coordinate system
Y	real	m	%+012.3lf	Y position in earth-fixed coordinate system
Z	real	m	%+012.3lf	Z position in earth-fixed coordinate system
VX	real	m/s	%+012.6lf	X velocity in earth-fixed coordinate system

VY	real	m/s	%+012.6lf	Y velocity in earth-fixed coordinate sys-tem
VZ	real	m/s	%+012.6lf	Z velocity in earth-fixed coordinate system
Quality	string	string	%13s	Values is/are TBD. This parameter is added to keep format compatibility with the DORIS Precise Orbit File Format. Default (“not used”) value is “0000000000000”

9.6.Orbit Event files

Orbit Event File is deprecated and is supported only for Cryosat mission.

9.6.1.Format

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section

2. Variable Header: It contains the information for of the reference frame of the state vectors in the file and the reference time for time recomputations. The format is in Table 154.

3. Data Block: It consists in a set of structures described in the tables below:

Table 165: Orbit Scenario File. Data_Block

Tag name	type	Attribute	C Format	Description
List_of_Orbit_Changes	List of <Orbit_Change> Structures (See Table 159)	count=”n” where n is the number of elements in the list	-	List of Orbital Changes
List_of_OSVs	List of <OSV> Structures (See)	count=”n” where n is the number of elements in the list	-	List of Orbit State Vectors

9.7.DORIS Navigator files

A DORIS Navigator file consist in two files, the header file and the data block file. They are compliant with [PDS_FMT]

9.8.Star Tracker files

A Star tracker file consists in a couple of files: the CryoSat standard header file and the data block file. They are compliant with [PDS_FMT]

9.9.Satellite Configuration File

9.9.1.Format

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section
2. Variable Header: Empty
3. Data Block: It consists in a set of structures described in the tables below:

9.11.1.Format

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section
2. Variable Header: Empty
3. Data Block: It consists in a set of structures described in the tables below. As it is a quite long file, only the relevant part to the CFIs are described.

Table 178: Star Tracker Configuration File. Data Block

Tag name	type	Attribute	C Format	Description
Satellite_Name	string	-	%s	Satellite Name
Mispointing	Structure (See Table 179)	-	-	Set of rotation angles needed for mispointing computation

Table 179: Star Tracker Configuration File. Mispointing

Tag name	type	Attribute	C Format	Description
Aberration_Correction	string	-	%s	Aberration correction flag. Possible values are: • Yes: for applying the aberration-correction. • No: for not applying the aberration correction. • Reverse: for applying the aberra- tion correction with the transposed matrix.
Star_Trackers_Limits	Structure (See Table 180)	-	-	Limits for the validity fo the quaternions
Star_Trackers_Priority	Structure (See Table 181)	-	-	Star trackers priority
List_of_Star_Trackers	Structure (See Table 182)	count=”n”	-	List of rotation angles from the antenna bench to the star trackers frame
Satellite_Mechanical_ To_Antenna_Bench	Structure (See Table 183)	-	-	Rotation angles from the satellite mechanical to the antenna bench frame
Satellite_Control_To_ Satellite_Mechanical	Structure (See Table 184)	-	-	Rotation angles from the satellite con- trol to the satellite mechanical frame
Satellite_Attitude_To_ Satellite_Control	Structure (See Table 179)	-	-	Rotation angles from the satellite con- trol to the satellite attitude frame

Table 180: Star Tracker Configuration File. Star tracker limits

Tag name	type	Attribute	C Format	Description
Max_Penalty	integer	-	%d	Maximum penalty for the quaternions
Quaternion_Norm_Threshold	real	-	%f	Threshold for the modulus of the quaternion
Max_Time_Gap	real	unit="s"	%f	Maximum time gap between two consequtive quaternions

Table 181: Star Tracker Configuration File. Star_Trackers_Priority

9.13.1.Format

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section
2. Variable Header: Empty.
3. Data Block: It consists in a set of structures described in the tables below.

Table 189: Swath Definition File. Data Block

Tag name	type	Attribute	C Format	Description
Swath	Structure (see Table 190)	-	-	Swath structure

Table 190: Swath Definition File. Swath

Tag name		type	Attribute	C Format	Description
Output_File_Description		string	-	%s	File Despcrition for the output swath template file
Output_File_Type		string	-	%s	File type for the output swath template file. It should have the fixed value “MPL_SWTREF”
Swath_Type		string	-	%s	Swath type. It can have one of the following values: • point • line • inertial
Num_Swath_Records		integer	-	%d	Number of points in the swath template file (>0)
Refraction		Structure (See Table 191)	-	-	Refraction model structure
Geometry Union:Choic e between the following structures:	List_of_S wath_Poin ts	List of swath geometry (see Table 192)	count=n (number f points in the instantane-ous swath, n>=1)	-	List with the geometry data for the calculation of every point in the instantaneour swath.
	Asar_Geo metry	Structure (defined in Table 196)	-	-	ASAR geomery

Sat_Nominal_Att	Structure (see Table 197)	-	-	Satellite Nominal Attitude initialization data
Sat_Att	Structure (see Table 198)	-	-	Satellite Attitude initialization data
Instr_Att	Structure (see	-	-	Instrument Attitude initialization

Table 191: Swath Definition File. Refraction

Tag name	type	Attribute	C Format	Description

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section
2. Variable Header: It consists in a set of structures described in the tables below.

Table 214: Swath Template File. Variable_Header

Tag name		type	Attribute	C Format	Description
Reference_OSF		string	-	%s	Orbit Scenario File used for generating the file
Reference_SDFSwath_Def_File		string	-	%s	Swath definition file used for generating the file
Absolute_Orbit		integer	-	%ld	Orbit for which the STF has been generated
Start_Validity_Orbit		integer	-	%ld	First orbit for which the STF is valid
Stop_Validity_Orbit		integer	-	%ld	Last orbit for which the STF is valid
Swath_Type		string. It can have one of the following values: • open • closed	-	%s	Swath type
Swath_Point_Type		string. It can have one of the following values: • geodetic • inertial	-	%s	Describes the type of swath points: inertial (RA and Declination) or geodetic (longitude and latitude)
One of the following options:	Orbit_Geometry	Structure (see Table 216)	-	-	Set of orbital parameters
	Orbit_State_Vector	Structure (see Table 217)	-	-	Orbit state vector
Time_Step		real	unit=”s”	%f	Seconds between two swath points
List_of_STF_Altitudes		List of <STF Altitude> (see Table 215)	count=”n” where n is the number of elements in the list (n>=1)	-	
Refraction		Structure (see Table 219)	-	-	Refraction data

9.15.1.Format

1. Fixed Header: For the fixed header format, refer to [EE_FMT] section
2. Variable Header: Empty
3. Data Block: It consists in a set of structures described in the tables below:

Table 224: Zone Database File. Data_Block

Tag name	type	Attribute	C Format	Description
List_of_Zones	List of <Zone> Structures (See Table 225)	count="n" where n is the number of elements in the list	-	List of zones

Table 225: Zone Database File. Zone

Tag name	type	Attribute	C Format	Description
Zone_Id	string	-	%s	Zone name
Zone_Description	string	-	%s	Zone description
Surface	string	-	%s	Type of surface
Projection	string	-	%s	Projection
Creator	string	-	%s	Cretator name
List_of_Polygon_Pts	list of structures <Polygon_Pt> (See Table 226)	count=”n” where n is the number of ele- ments in the list	-	List of points defining the zone.
Diameter	real	unit=”m”	%f	Diameter of the zone if the list of polygon points is emtpy.

Table 226: Zone Database File. Polygon_Pt

Tag name	type	Attribute	C Format	Description
Long	real	unit=”deg”	%f	longitude of the point (-360, 360)
Lat	real	unit=”deg”	%f	latitude of the point (-90, 90)
