DOCUMENT CHANGE LOG

THALES

All rights reserved, 2007, Thales Alenia Space

100181547K-EN

Issue	Date	Sections affected	Reason for change
01	18.04.08	All sections	First formal issue.
02	30.07.08	§ 3.2	Updated AU tail length. Added note in Sequence Flag description to highlight that the max TC packet size supported by AVS is 512 bytes which requires three TC Segments to uplink. Also the re-assembled TC packet is made transparent to the addressed PID.
		§ 3.3	Note added to provide a possible use of the CPDU TC Packet with multiple HPC instructions. Also the capability for Ground to Time-Tag or Position Tag HPC commands through AVS TC (2,144). Updated max CPDU TC Packet size linked to max TC Segment Data Field size which in turn is linked to AU Tail length.
		§ 3.7	Added a note to state that TC aggregation is not supported, but instead TC (134,1) is supported with the added advantages. Additional notes added on TC(134,1) to clarify the execution order of the embedded telecommands.
		§ 3.8	TC packet nesting updated to remove the nesting of C-SAR and PDHT TT-TC which are no longer applicable.
		§ 4.1	Included short description of the content of each VC. Part of PDR RID OP-179 disposition.
		§ 4.3	TM Data Field Header modified as per System PDR RID OP-146 disposition. OBT Status 2-bit field added replacing the 1-bit DM. Only applicable to AVS.
		§ 4.4	Added a note to state that "Idle" TM packets are generated by the ASW.
		§ 4.5	Added S/C OBT Status field to Time TM packet as per PDR RID OP-179 disposition. Added a note to state that the Time TM packet has no DFH, hence TM(9,2) not supported.
		§ 5.2	Added a note describing the differences between TC(2,144) and TC(2,3). TC(2,3) is not supported.
		§ 5.3	PUS service TC(3,2), TC(3,4), TC(3,7), TC(3,8), TC(3,11), TM(3,12) and TM(3,26) of TCU deleted to simplify TCU design. Added TC(3,129) and TM(3,130) to ICM, TCU and DSHA. Part of PDR RID OP-179 disposition.

Issue	Date	Sections affected	Reason for change
		§ 5.4	PUS service TC(4,1), TM(4,2) and TM(4,3) of SM ASW deleted in the scope of simplifying SM ASW. AVS TC(4,6), TC(4,7) and TM(4,9) services are implemented with specific AVS TC(4,144), TC(4,145) and TM(4,146) respectively.
		§ 5.5	PUS services TC(5,5), TC(5,6), TC(5,129) and TM(5,130) of TCU deleted in the scope of simplifying TCU design. The generation (instead of output) of event reports can be suppressed by TCU service 12.
		§ 5.6	Note added to describe the differences between TM(6,145) and TM(6,4) where TM(6,4) is not supported.
		§ 5.7	Service 8 set not applicable to ICM and GPS as covered by specific service type.
		§ 5.9	Service 11 removed from SES and DSHA as per PDR RID OP-145 disposition.
		§ 5.10	PUS services TC(12,5), TC(12,6), TC(12,10) and TM(12,11) of TCU deleted to simplify TCU design. Added a note to Service 12 to describe the link with Service 5 as per PDR RID OP-179 point 8 disposition.
		§ 5.12	SM ASW Service 14 deleted as considered not essential in the scope to simply SM ASW as per System PDR disposition.
		§ 5.13	Added a note to Service 15 describing the on-board managed Packet Stores including the System Log. Added TC(15,228) to request the downlink of PDHT Packet Store(s).
		§ 5.17	A description of the AVS mission specific service types added as per PDR RID OP-179 disposition.
		§ 6	All section 6 updated to define the Sentinel-1 reference PUS services data structures as per PDR OPS-178 disposition. The Sentinel-1 Type/Subtype reference data structure is specified reporting any known deviations. Where "none" is indicated there are no deviations. Where left blank it must be considered TBC as some harmonisation activity might be required.
		§ 8.1.2	Specified the use of Packet Category 6 : Auxiliary as per OIRD requirement.
		§ 8	Added sections 8.4 and 8.5 for the allocation of mission specific service type / subtype and RID numbering to the packet terminals

Issue	Date	Sections affected	Reason for change
03	07.01.09		All modifications with respect to issue 2 are shown with revision marks. Changes linked to ESOC dispositions agreed at OPS meetings and documented in "S1 PUS – ESOC Comments" Excel spreadsheet S1-TN-ESC-FS-6000 are referred to as ESOC-xxx-yyy where xxx refers to the comment category (e.g. GEN, S12, S18) and yyy is the comment number.
		§ 3.2	Updated AU tail length and max TC Segment Data field length.
		§ 3.3	Added description of CPDU function processing times.
		§ 3.4	Added clarification notes on max and min TC Packet sizes.
		§ 3.7	Modified TC(134,1) description to clarify order of execution of TC (134,1) embedded telecommands.
		§ 4.3	Added note to state constraints on fixed length TM packets as per ESOC-GEN-67
		§ 4.5	Modified Time Packet description to state that Time service covers TM(9,2).
		§ 4.6	- Added info on HPTM generation rate as per ESOC-GEN-64. - Updated HPTM format.
		§ 5.1	Added TC(1,128) and TC(1,129) which are only applicable to AVS as per ESOC-S1-38.
		§ 5.2	Deleted TC (2,147) and TC(2,150) as the function covered by TC(2,145) and TC(2,148) respectively.
		§ 5.3	- TC(3,129) set not applicable to ASW as Diagnostic packet size changes if collection interval is changed due to super-commutation parameters. Refer to ESOC-S3-80. - TC(3,5) and TC(3,6) not applicable to GPS as same function performed through private GPS service. Covers part of ESOC-GEN-86.
		§ 5.4	- TC(4,4) and TC(4,5) modified to enable/disable statistics function as per ESOC-S4-39. - TC(4,6), TC(4,7) and TM(4,9) set not applicable to NM ASW as implemented with private subtypes TC(4,144), TC(4,145) and TM (4,146) respectively which have been added.

Issue	Date	Sections affected	Reason for change
		§ 5.5	<ul style="list-style-type: none"> - TC(5,5) and TC(5,6) set not applicable to GPS as function covered by private subtypes TC(5,210) and TC(5,211) respectively. Covers part of ESOC-GEN-86. - TC(5,129) and TM(5,130) set not applicable to ASW as Event status is included in TM(19,153) and requested through TC(19,152). - TC(5,5) and TC(5,6) set not applicable to ASW as controlled through private subtype TC(19,146). - Added TC(5,210), TC(5,211), TC(5,212) and TM(5,213) specific to GPS only. Part of GPS commonality agreements between Sentinels. Covers part of ESOC-GEN-86.
		§ 5.6	<ul style="list-style-type: none"> - TC(6,2), TC(6,5), TM(6,6), TC(6,9) and TM(6,10) set not applicable to GPS as function covered by private subtypes. - Added TC(6,210), TC(6,212), TC(6,215), TM(6,216), TC(6,219) and TM(6,218) specific to GPS. Part of GPS commonality agreements between Sentinels. Covers part of ESOC-GEN-86. - Added clarification note on Dump TM packets generation. - TC(6,7) and TM(6,8) set not applicable ASW as they are covered by TC(6,9) and TM(6,10) and the availability of the physical address reported through TM(6,144). - Added TC(6,224) and TC(6,225) for DSHA SW boot and configuration update in EEPROM as per PDHT PDR RID PH-33 disposition.
		§ 5.8	<ul style="list-style-type: none"> - TM(9,1) set not applicable to ASW as it is not envisaged to change the Time report rate in flight. - TM(9,2) set applicable to ASW noting the fact that TM(9,2) has no PUS Data Field Header. As per ESOC-S9-32.
		§ 5.10	<ul style="list-style-type: none"> - Deleted erroneous duplicated text as per ESOC-S12-114. - TC(12,1) and TC(12,2) are not applicable to ASW as enable/disable is performed using MDS concept. ESOC-S12-115. - TC(12,10) set applicable to ASW. - Added TC(12,153), TC(12,154) and TM(12,155) applicable to NM and SM ASW. - Deleted superseded notes as per ESOC-S12-56.

Issue	Date	Sections affected	Reason for change
		§ 5.12	<ul style="list-style-type: none"> - TC(14,1), TC(14,2), TC(14,3), TM(14,4), TC(14,9), TC(14,10), TC(14,11) and TM(14,12) set applicable to SM ASW as per ESOC-S14-57. - TC(14,13), TC(14,14), TC(14,15) and TM(14,16) set not applicable to ASW as filtering of event reports not supported. - Added Note 3 on telemetry downlink rate.
		§ 5.13	<ul style="list-style-type: none"> - TC(15,11) set not applicable to DSHA. - TC(15,144) changed to Set Packet Store Configuration. - TC(15,145) deleted. - Added TC(15,229) applicable to DSHA.
		§ 5.15	<ul style="list-style-type: none"> - Added TC(18,130), TM(18,145), TM(18,162) and TM(18,224) to request and report the detailed definition of an OBOP where TC(18,130) applicable to ASW, ICM and DSHA; TM(18,145) applicable to ASW; TM(18,162) applicable to ICM; TM(18,224) applicable to DSHA. As per ESOC-S18-153.
		§ 5.16	<ul style="list-style-type: none"> - Corrected erroneous subtype numbering of now TM(19,155), TC(19,156) and TC(19,157) - Added TC(19,128) and TM(19,129) applicable to ICM and DSHA to request and report the single Event Action associated with a specific RID as per ESOC-S19-151A.
		§ 6.1.2	<ul style="list-style-type: none"> - Added clarification note on "complementary information" of TM (1,2) which is also applicable to TM(1,4), TM(1,6), and TM(1,8). - Updated TM(1,2) format deviations table.
		§ 6.1.8	Updated TM(1,8) format deviations table.
		§ 6.1.9 & § 6.1.10	Added description of TC(1,128) and TC(1,129) function as per ESOC-S1-74.
		§ 6.2	<ul style="list-style-type: none"> - Added notes on CPDU TC and 1553B low level commands as per ESOC-S2-48 and ESOC-S2-75.
		§ 6.2.1	Updated TC(2,144) description.
		§ 6.2.2	Modified TC(2,145) to cover both RX and TX 1553B requests.
		§ 6.2.3	Updated TM(2,146) description to reflect the reporting of both RX and TX requests
		§ 6.2.4	TC(2,148) function changed to cover both TX and RX 1553B low level commands.
		§ 6.2.5	Updated TM(2,149) description to reflect the reporting of both RX and TX requests.

Issue	Date	Sections affected	Reason for change
		§ 6.3	As per MOM S1-MN-ASD-PL-0101, spare bytes removed by extending parameters size (e.g. SID, N, NPAR). Covers also ESOC-S3-79.
		§ 6.3.1	TC(3,1) format changed removing parameter over-sampling part as per ESOC-S3-80.
		§ 6.3.2	TC(3,2) format changed as for TC(3,1). TC(3,2) description updated to reflect capability to support super-commutation.
		§ 6.3.3	TC(3,3) format changed deleting padding byte, increased SID size to 1 word.
		§ 6.3.4	TC(3,4) format changed as for TC(3,3).
		§ 6.3.5	TC(3,5) format changed as for TC(3,3).
		§ 6.3.6	TC(3,6) format changed as for TC(3,3).
		§ 6.3.7	TC(3,7) format changed as for TC(3,3).
		§ 6.3.8	TC(3,8) format changed as for TC(3,3).
		§ 6.3.9	TC(3,9) format changed as for TC(3,3).
		§ 6.3.10	TM(3,10) format changed as for TC(3,1).
		§ 6.3.11	TC(3,11) format changed as for TC(3,3).
		§ 6.3.12	TM(3,12) format changed as for TC(3,1).
		§ 6.3.13	<ul style="list-style-type: none"> - TM(3,25) format changed as for TC(3,3). - Added note to specify TM(3,25) SID constraint on single packet as per ESOC-GEN-67 - Added GPS TM(3,25) format showing deviation.
		§ 6.3.14	<ul style="list-style-type: none"> - TM(3,26) format changed as for TC(3,3). - Added note to specify TM(3,26) SID constraint on single packet as per ESOC-GEN-67
		§ 6.3.15	TC(3,128) format changed as for TC(3,3).
		§ 6.3.16	TC(3,129) format changed as for TC(3,3). TC(3,129) not supported by ASW as packet size changes if collection interval is changed due to super-commutation. Refer to ESOC-S3-80.
		§ 6.3.18	TM(3,131) format changed deleting padding bytes, increased NSID and SID size to 1 word.
		§ 6.3.20	TM(3,133) format changed as for TM(3,131).
		§ 6.4.2	Added "Last Packet" and "Report Integrity Counter" fields to TM(4,2) as the report could be composed of multiple packets.
		§ 6.4.4	TC(4,4) changed from "Enable Periodic Parameter Statistics Reporting" to "Enable Statistics Function" as per ESOC-S4-39.

Issue	Date	Sections affected	Reason for change
		§ 6.4.5	- TC(4,5) changed from "Disable Periodic Parameter Statistics Reporting" to "Disable Statistics Function" as per ESOC-S4-39.
		§ 6.4.9	- Added "Last Packet" and "Report Integrity Counter" fields to TM(4,9) as the report could be composed of multiple packets. Sampling interval field deleted as per ESOC-S4-84.
		§ 6.4.11	Added AVS TC(4,144) which is AVS specific of TC(4,6).
		§ 6.4.12	Added AVS TC(4,145) which is AVS specific of TC(4,7).
		§ 6.4.13	Added AVS TM(4,146) which is AVS specific of TM(4,9).
		§ 6.5.1	Added GPS TM(5,1) format showing deviation from standard S1 TM(5,1).
		§ 6.5.2	Added GPS TM(5,2) format showing deviation from standard S1 TM(5,2).
		§ 6.5.3	Added GPS TM(5,3) format showing deviation from standard S1 TM(5,3).
		§ 6.5.4	Added GPS TM(5,4) format showing deviation from standard S1 TM(5,4).
		§ 6.6.1	TC(6,1) format changed, increased Memory ID and N size to 1 word.
		§ 6.6.2	- TC(6,2) format changed as for TC(6,1). - Added ASW TC(6,2) format showing deviation with respect to standard S1 TC(6,2) format.
		§ 6.6.3	TC(6,3) format changed as for TC(6,1).
		§ 6.6.4	- TC(6,5) format changed, increased Memory ID and N size to 1 word and Length_6_5 to 2 words. - Added ASW TC(6,5) format showing deviation with respect to standard S1 TC(6,5) format.
		§ 6.6.5	TM(6,6) format changed. Increased Memory ID to 1 word and added Length field.
		§ 6.6.6	TC(6,9) format changed, increased Memory ID size to 1 word and Length_6_9 to 2 words.
		§ 6.6.7	TM(6,10) format changed as for TC(6,9).
		§ 6.6.9	TC(6,145) format changed, increased Memory ID size to 1 word.
		§ 6.6.10	TC(6,146) description added and format changed, increased N size to 1 word. Covers part of ESOC-S6-94.
		§ 6.6.12	Added TM (6,148) format.
		§ 6.6.13	Added TC (6,149) format.
		§ 6.6.14	Added TC (6,150) format.

Issue	Date	Sections affected	Reason for change
		§ 6.6.15	Added TM (6,151) format.
		§ 6.6.17	TC(6,162) description extended to cover operational use as part of ESOC-S6-94.
		§ 6.6.18	Added TC(6,210)
		§ 6.6.19	Added TC(6,212)
		§ 6.6.20	Added TC(6,215)
		§ 6.6.21	Added TM(6,216)
		§ 6.6.22	Added TC(6,219)
		§ 6.6.23	Added TM(6,218)
		§ 6.6.24	Added TC(6,224) format applicable to DSHA as part of PDHT PDR RID PH-33 disposition.
		§ 6.6.25	Added TC(6,225) format applicable to DSHA as part of PDHT PDR RID PH-33 disposition.
		§ 6.8.1	TC(9,1) format deleted as TC(9,1) not supported by ASW. Time packet generation rate is configurable as an SMU Mission PROM parameter. Covers ESOC-S9-96.
		§ 6.8.2	New section added to cover TM(9,2).
		§ 6.8.3	Added description of TC(9,144) function as per ESOC-S9-97.
		§ 6.8.4	Added description of TC(9,145) function as per ESOC-S9-98.
		§ 6.8.5	Added description of TC(9,146) function as per ESOC-S9-99.
		§ 6.8.6	Added description of TC(9,147) function as per ESOC-S9-100.
		§ 6.8.7	Added description of TC(9,148) function as per ESOC-S9-100.
		§ 6.8.8	Updated description of TC(9,129) to clarify use as per ESOC-S9-103.
		§ 6.8.10	TM(9,160) field corrected to TCM Current Time.
		§ 6.9.1	Added cases N1 = 0 and N2 = 0 to TC(11,1) as per ESOC-S11-106.
		§ 6.9.2	Added cases N1 = 0 and N2 = 0 to TC(11,2) as per ESOC-S11-106.
		§ 6.9.6	Deleted "Number of Telecommands" field from TC(11,6). Added case N1 = 0 of TC(11,6) as per ESOC-S11-108.
		§ 6.9.7	Deleted "Number of Telecommands" field from TC(11,144). Added case N1 = 0 of TC(11,6) as per ESOC-S11-108.
		§ 6.9.9	Added case N1 = 0 of TC(11,8) as per ESOC-S11-109.
		§ 6.9.10	Added case N1 = 0 of TC(11,145) as per ESOC-S11-109.
		§ 6.9.17	- Corrected TM(11,19) adding the missing repetition loops. - Added note as per ESOC-S11-112.

Issue	Date	Sections affected	Reason for change
		§ 6.10.1	- TC(12,1) format changed deleting padding byte, N size increased to 1 word. - Added note on global enable when N set to 0 as per ESOC-S3-118.
		§ 6.10.2	- TC(12,2) format changed as for TC(12,1). - Added note on global disable when N set to 0 as per ESOC-S3-118.
		§ 6.10.3	Added TC(12,5) format as per ESOC-S12-41 and also covers part of ESOC-S12-116.
		§ 6.10.4	TC(12,6) format changed as for TC(12,1).
		§ 6.10.5	TC(12,7) format changed deleting padding bytes. N, NOL and NOE sizes increased to 1 word.
		§ 6.10.7	Added missing TM(12,9) format.
		§ 6.10.8	TC(12,10) set applicable also to NM ASW and SM ASW
		§ 6.10.9	TM(12,11) format changed deleting padding byte. N size increased to 1 word.
		§ 6.10.10	Added TC(12,144) format. Covers part of ESOC-S12-43.
		§ 6.10.11	Added TC(12,145) format.
		§ 6.10.12	Added TC(12,146) format.
		§ 6.10.13	Added TC(12,147) format.
		§ 6.10.14	Added TC(12,148) format.
		§ 6.10.15	Added TC(12,149) format.
		§ 6.10.16	Added TC(12,150) format.
		§ 6.10.17	Added TC(12,151) format.
		§ 6.10.18	Added TC(12,152) format. Covers part of ESOC-S12-43.
		§ 6.10.20	Added TC(12,154) format
		§ 6.10.23	Added TC(12,161) format. Covers part of ESOC-S12-43.
		§ 6.10.24	Added TM(12,162) format. Covers part of ESOC-S12-43.
		§ 6.12.1	- TC(14,1) format changed. Deleted padding byte and increased N2 and N3 size to 1 word. Added padding byte for both Type and Subtype as per ESOC-S14-120. - TC(14,1) set applicable also to SM ASW.
		§ 6.12.2	- TC(14,2) format changed as for TC(14,1) and ESOC-S14-120. - TC(14,2) set applicable also to SM ASW.
		§ 6.12.3	TC(14,3) set applicable also to SM ASW
		§ 6.12.4	- Added "Last Packet" and "Report Integrity Counter" fields to TM(14,4) as the report could be composed of multiple packets. Added padding bytes to Type and Subtype as per ESOC-S14-120. - TC(14,4) set applicable also to SM ASW

Issue	Date	Sections affected	Reason for change
		§ 6.12.5	- TC(14,144) format changed deleting padding byte. N2 and SID sizes increased to 1 word as per ESOC-S14-120. - TC(14,144) set applicable also to SM ASW
		§ 6.12.6	- TC(14,145) format changed as for TC(14,144). - TC(14,145) set applicable also to SM ASW
		§ 6.12.7	TC(14,7) set applicable also to SM ASW
		§ 6.12.8	- TM(14,146) format changed deleting padding byte. N2 and SID sizes increased to 1 word as per ESOC-S14-120 - TM(14,146) set applicable also to SM ASW
		§ 6.12.9	- TC(14,147) format changed as for TM(14,146). - TC(14,147) set applicable also to SM ASW
		§ 6.12.10	- TC(14,148) format changed as for TM(14,146). - TC(14,148) set applicable also to SM ASW
		§ 6.12.11	TC(14,11) set applicable also to SM ASW
		§ 6.12.12	- TM(14,149) format changed deleting padding bytes. N2 and SID sizes increased to 1 word as per ESOC-S14-120. - TM(14,149) set applicable also to SM ASW
		§ 6.13.3	TC(15,3) format changed. Type and subtype nesting chosen. Covers ESOC-S15-123.
		§ 6.13.4	TC(15,4) format changed. Type and subtype nesting chosen. Covers ESOC-S15-123.
		§ 6.13.6	TM(15,6) format changed.
		§ 6.13.9	Added TC(15,12) format
		§ 6.13.11	Added TC(15,129) format
		§ 6.13.12	Changed TC(15,144) format
		§ 6.13.16	Added TM (15,224). Part of ESOC-S15-34.
		§ 6.13.17	Added TC (15,225). Part of ESOC-S15-34.
		§ 6.13.18	Added TC (15,226). Part of ESOC-S15-34.
		§ 6.13.19	Added TC (15,227). Part of ESOC-S15-34.
		§ 6.13.20	Added TC (15,228)
		§ 6.15.11	Added TC(18,130) format.
		§ 6.15.12	Added TM(18,145) format.
		§ 6.15.13	Added TM(18,162)
		§ 6.15.14	Added TM(18,224)
		§ 6.16.1	TC(19,1) format changed deleting padding byte. N size increased to 1 word.
		§ 6.16.2	TC(19,2) format changed as for TC(19,1).
		§ 6.16.3	TC(19,4) format changed as for TC(19,1).
		§ 6.16.4	TC(19,5) format changed as for TC(19,1).
		§ 6.16.6	TM(19,7) format changed as for TC(19,1).
		§ 6.16.7	Added TC(19,128) format.

Issue	Date	Sections affected	Reason for change
		§ 6.16.8	Added TM(19,129) format.
		§ 6.16.23	TC(19,160) format changed as for TC(19,1).
		§ 6.17.3.1	Added cases N1 = 0 and N2 = 0 of TC(132,1) as per ESOC-S132-143.
		§ 6.17.3.2	Added cases N1 = 0 and N2 = 0 of TC(132,2) as per ESOC-S132-143.
		§ 6.17.3.6	Deleted "Number of Telecommands" field from TC(132,6).
		§ 6.17.3.7	Deleted "Number of Telecommands" field from TC(132,144).
		§ 6.17.3.13	Corrected TM(132,19) adding the missing repetition loops.
		§ 6.17.5.1	TC(134,1) format changed deleting padding byte. P size increased to 1 word.
		§ 8.1.1	Assigned GPS and SES PID
		§ 8.4	Updated allocation of Types 5, 6 and 8 subtypes to GPS (as per Sentinels commonality agreements) and Type 8 subtypes to C-SAR (C-SAR uses mission specific Type for function management).
		§ 8.5	Report ID (RID) category assignment modified.
		§ 8.6	Added Structure Identification (SID) parameter structure in order to achieve unique SID definitions. Same structure adopted as for RID.
04	16.04.10		All modifications with respect to issue 3 are shown with revision marks. Changes linked to ESOC dispositions agreed at OPS meetings and documented in "S1 PUS – ESOC Comments" Excel spreadsheet S1-TN-ESC-FS-6000 are referred to as ESOC-xxx-yyy where xxx refers to the comment category (e.g. GEN, S12, S18) and yyy is the comment number.
		§ 2.3	Added reference documents [RD.02] to [RD.09].
		§ 3.1	Specified S-1A & S-1B SC ID as per ESOC-GEN-6 and ESOC-GEN-162
		§ 3.2	Updated MAP assignments, added clarification notes and AU tail definition. Added clarification note on TC segmentation in Sequence Flag description as per ESOC-TC SEG-163. Added clarification statement on max size TC Segment Data field and AU Tail presence as per ESOC-TC SEG-165 Added AU function summary description with reference to [RD.08] and AU Tail structure and fields description as per ESOC-TC SEG-166

Issue	Date	Sections affected	Reason for change
		§ 3.3	Updated CPDU description to reflect SMU TMTCCM module design. Added clarification on CPDU timer time-out period as per ESOC-CPDU TC-167
		§ 3.4	Added clarification note to TC packet PEC field description. Added info on DHF flag as per ESOC-DHF_FLAG-237
		§ 3.5	TC(11,4) Sub-schedule ID size increased from 8-bits to 11-bits as per ESOC request. N° of TC Packets size reduced to 5 bits.
		§ 3.6	Similarly, TC(132,4) Sub-schedule ID size increased from 8-bits to 11-bits as per ESOC request. N° of TC Packets size reduced to 5 bits.
		§ 4.1	Corrected Packet Store to VC mapping as per ESOC comment ESOC-TM FRAME-183 Specified S-1A & S-1B SC ID. Part of ESOC-TM FRAME-182
		§ 4.3	Added clarification note to TC packet PEC field description. Corrected Grouping Flag which is set to 11 to indicate self-contained TM packets as per ESOC-TM PACKET-185 Added clarification notes on Packet Length and minimum size as per ESOC-TM PACKET-186
		§ 4.4	Source Sequence Count value changed from 3FFF to 0000 as per ESOC comment ESOC-IDLE-246
		§ 4.5	Added info of Time Pkt generation rate which is fixed for the mission. Corrected Time TM Pkt Length value as per ESOC-TIME-248.
		§ 4.6	Updated HPTM format. Part of ESOC-GEN-63.
		§ 5.1	Added TC(1,160) to reflect ICM design. Added LCT Service 1 subtypes.
		§ 5.2	Deleted TC(2,145), TM(2,146), TC(2,148) and TM(2,149) as replaced by remote RT specific low level commands

Issue	Date	Sections affected	Reason for change
		§ 5.3	Set TC(3,1) and TC(3,3) also applicable to SM ASW making Service 3 identical to both NM ASW and SM ASW. Set TC(3,2) TC(3,4) TC(3,7) TC(3,8) TC(3,9) TM(3,10) TC(3,11) TM(3,12) TM(3,26) TC(3,129) TC(3,130) TM(3,131) TC(3,132) TM(3,133) not applicable to DSHA Added TC(3,160) and TC(3,161) to reflect ICM and TCU design. Added TM(3,144) and TM(3,145) for AVS which could require multiple packet report. Added LCT Service 3 subtypes.
		§ 5.4	TC(4,3) set not applicable to ICM where statistics are reset with TC(4,1). TC(4,6) and TM(4,9) set not applicable to ICM as replaced with TC(4,161) and TM(4,162) respectively. Added TC(4,160) required by ICM. Added TC(4,161) and TM(4,162) replacing TC(4,6) and TM(4,9) respectively.
		§ 5.5	Added TC(5,160) required by ICM. Added LCT Service 5 subtypes.
		§ 5.6	Added TC(6,161) and TC(6,162) to reflect TCU design. Added LCT Service 6 subtypes.
		§ 5.7	Added TC(8,217) to TC(8,222) to reflect TCU design. Added TC(8,225) to TC(8,232) applicable to DSHA Added LCT Service 8 TC(8,240) to TM(8,245).
		§ 5.8	Added LCT Service 9 subtypes.
		§ 5.10	Set TC(12,7) not applicable to ICM as replaced by TC(12,163) Set TC(12,160) applicable to TCU Added TC(12,225) TC(12,227) TM(12,229) applicable to DSHA. TC(12,225) replaces TC(12,5). TC(12,7) and TC(12,9) no longer applicable to DSHA. Added TC(12,163) applicable to ICM
		§ 5.13	Added TC(15,149) applicable to NM ASW and SM ASW Added TC(15,229), TC(15,230), TC(15,231) , TC(15,232), TC(15,233) and TC(15,234) applicable to DSHA. Set TC(15,128) and TC(15,129) not applicable to DSHA..
		§ 5.14	Added LCT Service 17

Issue	Date	Sections affected	Reason for change
		§ 5.15	Set all Service 18 not applicable to DSHA. ESOC-S18-45 no longer applicable. Set TC(18,8) not applicable to ASW as replaced with TC(18,145) Set TC(18,8) not applicable to ICM as replaced with TC(18,162) Added TM(18,163) applicable to ICM. Added TC(18,145), TC(18,146), TC(18,147), TC(18,148), TC(18,149) and TC(18,151) applicable to ASW. Set TC(18,10) and TM(18,11) not applicable to ICM as combined service provided by TC(18,162) and TM(18,163) Added note on add, modify and delete OBOP as per ESOC-S18-132
		§ 5.16	Set Service 19 not applicable to DSHA.
		§ 5.17.1	Added ASW Service 130 Command DB Management list of subtypes
		§ 5.17.6	Added ASW Service 135 S/C Management list of subtypes
		§ 5.17.7	Added ASW Service 136 SM AOCS Management list of subtypes
		§ 5.17.8	Added ASW Service 137 NM AOCS Management list of subtypes
		§ 5.17.9	Added ASW Service 160 RM Oscillator list of subtypes
		§ 5.17.10	Added ASW Service 161 Common Resources list of subtypes
		§ 5.17.11	Added ASW Service 162 EPS-TCS Management list of subtypes
		§ 5.17.12	Added ASW Service 163 Payload Management list of subtypes
		§ 5.18.1	Added Service 152 SES Function Management with list of subtypes
		§ 5.19.1	Added Service 176 PDHT Mode Transitions list of subtypes
		§ 5.19.2	Added Service 177 PDHT Configuration list of subtypes
		§ 5.19.3	Added Service 178 PDHT Function Management list of subtype services
		§ 5.20.1	Added GPSR Service 210 Mode Service subtype
		§ 5.20.2	Added GPSR Service 211 Parameter Service subtypes
		§ 5.20.3	Added GPSR Service 212 Science Data Service subtype
		§ 5.20.4	Added GPSR Service 213 Periodical Memory Service subtypes
		§ 5.21.1	Added LCT Service 248 Parameter Management list of subtypes

Issue	Date	Sections affected	Reason for change
		§ 5.21.2	Added LCT Service 249 Unit Mode Transitions list of subtypes
		§ 5.21.3	Added LCT Service 250 Standby Mode list of subtypes
		§ 5.21.4	Added LCT Service 251 Acquisition and Communications Mode list of subtypes
		§ 5.21.5	Added LCT Service 252 Table Management list of subtypes
		§ 5.21.6	Added LCT Service 253 Commanded Functional Test Mode list of subtypes
		§ 5.21.7	Added LCT Service 255 Launch Lock Release Mode list of subtypes
		§ 6	Added a note in each of the TM report which could be composed of multiple TM packets to state that each TM packet must be self consistent as per ESOC-GEN-68.
		§ 6.1.11	Added TC(1,160) section, description and format for ICM.
		§ 6.2	Deleted TC(2,145), TM(2,146), TC(2,148) and TM(2,149) formats as replaced by ASW specific low level commands for each 1553B RT
		§ 6.3.21	Added TM(3,144)
		§ 6.3.22	Added TM(3,145)
		§ 6.3.23	Added TC(3,160) section, description and format for ICM.
		§ 6.3.24	Added TC(3,161) section, description and format for ICM.
		§ 6.4.14	Added TC(4,160) section, description and format for ICM.
		§ 6.4.15	Added TC(4,161) section, description and format for ICM.
		§ 6.4.16	Added TM(4,162) section, description and format for ICM.
		§ 6.5.9	Added TC(5,160) section, description and format for ICM.
		§ 6.5.10	Added TC(5,210) section and description for GPSR
		§ 6.5.11	Added TC(5,211) section and description for GPSR
		§ 6.5.12	Added TC(5,212) section and description for GPSR
		§ 6.5.13	Added TC(5,213) section and description for GPSR
		§ 6.6.5	Added TCU specific TM(6,6) format showing variation wrt other packet terminal TM(6,6) format.
		§ 6.6.16	TC(6,161) set applicability to TCU.
		§ 6.6.17	TC(6,162) set applicability to TCU.
		§ 6.7.1	Added TC(8,217) section, description and format for TCU.
		§ 6.7.2	Added TC(8,218) section, description and format for TCU.
		§ 6.7.3	Added TC(8,219) section, description and format for TCU.
		§ 6.7.4	Added TC(8,220) section, description and format for TCU.
		§ 6.7.5	Added TC(8,221) section, description and format for TCU.
		§ 6.7.6	Added TC(8,222) section, description and format for TCU.
		§ 6.7.7	Added TC(8,225) section, description and format for DSHA.
		§ 6.7.8	Added TC(8,226) section, description and format for DSHA.
		§ 6.7.9	Added TC(8,227) section, and description for DSHA.

Issue	Date	Sections affected	Reason for change
		§ 6.7.10	Added TC(8,228) section, description and format for DSHA.
		§ 6.7.11	Added TC(8,229) section, description and format for DSHA.
		§ 6.7.12	Added TC(8,230) section and description for DSHA.
		§ 6.7.13	Added TC(8,231) section, description and format for DSHA.
		§ 6.7.14	Added TC(8,232) section and description for DSHA.
		§ 6.8.10	Added Figure 6.8.10-2 to define Time formats in TM(9,160) as per ESOC-S9-104
		§ 6.9.1	Changed Sub-Schedule ID size and APID replaced with PID in TC(11,1)
		§ 6.9.2	Changed Sub-Schedule ID size and APID replaced with PID in TC(11,2)
		§ 6.9.5	Replaced APID with PID in TC(11,5)
		§ 6.9.6	Changed Sub-Schedule size in TC(11,6)
		§ 6.9.7	Replaced APID with PID in TC(11,144)
		§ 6.9.8	Replaced APID with PID in TC(11,7)
		§ 6.9.9	Changed Sub-Schedule size in TC(11,8)
		§ 6.9.10	Replaced APID with PID in TC(11,145)
		§ 6.9.11	Changed Sub-Schedule size in TM(11,10)
		§ 6.9.12	Changed Sub-Schedule size in TM(11,13)
		§ 6.9.14	Replaced APID with PID in TC(11,16)
		§ 6.9.17	Changed Sub-Schedule ID size and APID replaced with PID in TM(11,19)
		§ 6.10.7	Set TC(12,9) applicable to TCU
		§ 6.10.10	Modified TC(12,144) format
		§ 6.10.19	Added TM(12,153) description and format
		§ 6.10.21	Added TM(12,155) description and format
		§ 6.10.22	Set TC(12,160) applicable to TCU
		§ 6.10.24	Modified TC(12,162) format
		§ 6.10.25	Added TC(12,163) section, description and format for ICM.
		§ 6.12.1	Replaced APID with PID in TC(14,1)
		§ 6.12.2	Replaced APID with PID in TC(14,2)
		§ 6.12.4	Replaced APID with PID in TM(14,4)
		§ 6.13.3	Replaced APID with PID in TC(15,3)
		§ 6.13.4	Replaced APID with PID in TC(15,4)
		§ 6.13.6	Replaced APID with PID in TM(15,6)
		§ 6.13.16	Added TC(15,149) description and format.
		§ 6.13.17	Added TM(15,224) description and format for DSHA as per ESOC-S15-44
		§ 6.13.18	Added TC(15,225) description and format for DSHA as per ESOC-S15-44
		§ 6.13.19	Added TC(15,226) description and format for DSHA as per ESOC-S15-44

Issue	Date	Sections affected	Reason for change
		§ 6.13.20	Added TC(15,227) description and format for DSHA as per ESOC-S15-44
		§ 6.13.21	Added TC(15,228) description and format for DSHA as per ESOC-S15-44
		§ 6.13.22	Added TC(15,229) description and format for DSHA
		§ 6.13.23	Added TC(15,230) description and format for DSHA
		§ 6.13.24	Added TC(15,231) description and format for DSHA
		§ 6.13.25	Added TC(15,232) description and format for DSHA
		§ 6.13.26	Added TC(15,233) description and format for DSHA
		§ 6.13.27	Added TC(15,234) description and format for DSHA
		§ 6.15.1	Updated TC(18,144) format
		§ 6.15.2	Updated TC(18,160) format
		§ 6.15.6	Updated TC(18,162) subtype
		§ 6.15.7	Added TC(18,145) description and format
		§ 6.15.8	Updated TM(18,146) subtype
		§ 6.15.9	Added TM(18,163) description and format for ICM.
		§ 6.15.11	Added TC(18,149)
		§ 6.15.13	Added TC(18,151)
		§ 6.15.14	Added TC(18,147) description and format for ASW
		§ 6.15.15	Added TC(18,148) description and format for ASW
		§ 6.15.16	Added TM(18,164) description and format for ICM
		§ 6.16.8	Modified TM(19,129) to add missing 'Last Packet' and Report Integrity Counter' fields as report could require two TM packets. Also added 'Length' field
		§ 6.16.9	Added TC(19,144) description and format as per ESOC-S19-46
		§ 6.16.10	Added TC(19,145) format as per ESOC-S19-46
		§ 6.16.11	Added TC(19,146) format as per ESOC-S19-46
		§ 6.16.12	Added TC(19,147) format as per ESOC-S19-46
		§ 6.16.14	Added TM(19,149) format as per ESOC-S19-46
		§ 6.16.15	Added TC(19,150) format as per ESOC-S19-46
		§ 6.16.16	Added TM(19,151) format as per ESOC-S19-46
		§ 6.16.17	Added TC(19,152) format as per ESOC-S19-46
		§ 6.16.18	Added TM(19,153) format as per ESOC-S19-46
		§ 6.16.19	Added TC(19,154) format
		§ 6.16.20	Added TM(19,155) format
		§ 6.16.21	Added TC(19,156) format
		§ 6.16.22	Added TC(19,157) format
		§ 6.17.1.1 to 6.17.1.10	Added for ASW specific Service 130 subtypes description and formats
		§ 6.17.3.1	Changed Sub-Schedule ID size and APID replaced with PID in TC(132,1)

Issue	Date	Sections affected	Reason for change
		§ 6.17.3.2	Changed Sub-Schedule ID size and APID replaced with PID in TC(132,2)
		§ 6.17.3.5	Replaced PID with PID in TC(132,5)
		§ 6.17.3.6	Changed Sub-Schedule ID size in TC(132,6)
		§ 6.17.3.7	Replaced PID with PID in TC(132,144)
		§ 6.17.3.8	Changed Sub-Schedule ID size in TM(132,10)
		§ 6.17.3.9	Changed Sub-Schedule ID size in TM(132,13)
		§ 6.17.3.10	Replaced PID with PID in TC(132,16)
		§ 6.17.3.13	Changed Sub-Schedule ID size and APID replaced with PID in TM(132,19)
		§ 6.17.4.3	Modified TM(133,3) format.
		§ 6.18.1	Section added for GPSR specific Service 210: Mode Service
		§ 6.18.1.1	Added Service 210 sub-type description. The formats and parameter details are specified in [RD.04].
		§ 6.18.2	Section added for GPSR specific Service 211: Parameter Service
		§ 6.18.2.1 to 6.18.2.3	Added Service 211 sub-types description. The formats and parameter details are specified in [RD.04].
		§ 6.18.3	Section added for GPSR specific Service 212: Science Data Service
		§ 6.18.3.1	Added Service 212 sub-type description. The formats and parameter details are specified in [RD.05].
		§ 6.18.4	Section added for GPSR specific Service 213: Periodic Memory Service
		§ 6.18.4.1 to 6.18.4.3	Added Service 213 sub-types description. The formats and parameter details are specified in [RD.04].
		§ 6.19.1	Section added for C-SAR specific Service 152: SES Function Management
		§ 6.19.1.1 to 6.19.1.67	Added all Service 152 specific sub-types 160 to 226 description. The formats and parameter details are specified in [RD.02].
		§ 6.20.1	Section added for PDHT specific Service 176: PDHT Mode Transitions
		§ 6.20.1.1 to 6.20.1.5	Added Service 176 sub-types description. The formats and parameter details are specified in [RD.06].
		§ 6.20.2	Section added for PDHT specific Service 177: PDHT Configuration
		§ 6.20.2.1 to 6.20.2.4	Added Service 177 sub-types description. The formats and parameter details are specified in [RD.06].
		§ 6.20.3	Section added for PDHT specific Service 178 PDHT Function Management

Issue	Date	Sections affected	Reason for change
		§ 6.20.3.1 to 6.20.3.7	Added Service 178 sub-types description. The formats and parameter details are specified in [RD.06].
		§ 8.1.1	Assigned different APID for SMU TM-1 HPTM and SMU TM-2 HPTM. Assigned PID to ASW applications for both NM and SM Assigned PID to LCT
		§ 8.3.2	Added AVS Parameter # structure definition
		§ 8.3.3	Added C-SAR SES Parameter # structure definition
		§ 8.3.4	Added C-SAR SAS Parameter # structure definition
		§ 8.4	Assigned mission specific service type/subtype ranges to LCT Assigned additional mission specific service type ranges to ASW.
		§ 8.5	Updated RID range assignments
		§ 8.6	Updated SID range assignments
		§ 9	Added Service Parameter Definition section. Parameter type column included in each Service Type table defining the parameters as per ESOC-GEN-158
05	22.10.10		All modifications with respect to issue 4 are shown with revision marks.
		§ 1.2.3	Added new section on TM & TC Packet Layout Convention as per SYS CDR AI S1-CDR-OP128-091.
		§ 3.3	RM CPDU and RM SGM TC packet formats added as per ESOC-TC PKT-171.
		§ 3.5-6	Corrected the note on the deletion of expired TT-TC / PT-TC when the expired TT-TC is disabled. ESOC-S11-175 and ESOC-S132-179 query.
		§ 3.8	Added a clarification note on embedded TC with respect to PEC and SSC.
		§ 4.3	Added note on the use of the Error Flag as per ESOC-EF Flag-244.
		§ 5.4	Added "AVS" to title of TM(4,146) & added "SES" to title of TM(4,146), TM(4,161) and TM(4,162). Also updated corresponding § 6 as per ESOC-S4-210.
		§ 5.5	Deleted TC(5,240) and TM(5,241) as LCT now implements TC(5,129) and TM(5,130) as per ESOC-S5-195
		§ 5.7	Added "LCT" or "TCU" to service 8 subservices titles as applicable, as proposed by ESOC-S8-216. Also modified the same subservice titles in § 6.7.
		§ 5.18.1	TC(152,215) "Reset ICM" is also set applicable to ICM Boot.

Issue	Date	Sections affected	Reason for change
		§ 6	Corrected Figure 6-2.
		§ 6.1.9-10	Clarified the meaning of "hard-coded TC" in TC(1,128) and TC(1,129) as per ESOC-S1-205.
		§ 6.4.16	Deleted Last Packet and Report Integrity Counter fields from SES TM(4,162) as only a single packet report is applicable. This is reflected in Issue 11 of the SES TM/TC Definitions Document.
		§ 6.5.10-13	Added "GPSR" to TC(5,210), TC(5,211), TC(5,212) and TM(5,213) as per ESOC-S5-212.
		§ 6.6.2	Added ICM Boot restriction on TC(6,2) to state that only the load of one contiguous area of memory is supported.
		§ 6.6.4	Added ICM Boot restriction on TC(6,5) to state that only the dump of a single contiguous memory area is supported.
		§ 6.6.5	Updated description of TCU deviations on TM(6,6).
		§ 6.6.8	Corrected TM(6,144) description as per ESOC-S6-284.
		§ 6.6.19	Clarified that TC(6,212) is also used to write in EEPROM as per ESOC-S6-280.
		§ 6.6.26	Added TC(6,241) format
		§ 6.6.27	Added TC(6,242) format
		§ 6.6.28	Added TC(6,243) format
		§ 6.10.5	Deleted the statement "size depends on Parameter #" in TC(12,7) as not applicable.
		§ 6.10.9	Deleted the statement "size depends on Parameter #" in TM(12,11) as not applicable.
		§ 6.10.25	Deleted the statement "size depends on Parameter #" in TC(12,163) as not applicable.
		§ 6.13.4	TC(15,4) renamed "Remove Packets from Storage Definition" as per ESOC-S15-220.
		§ 6.15.9	Removed "Last packet", "Report Integrity Counter" and "NPROC" in TM(18,163) as SES always lists the status of the 32 possible OBOPs, so TM(18,163) is a fixed structure with 32 data sets and there is no need for multiple packets. This is reflected in Issue 10 (or later) of the SES TM/TC Definitions Document
		§ 6.15.11	Added clarification note to TC(18, 149) description on the Gound capability to use TC(18, 149) as per SYS CDR AI S1-CDR-OP73-127.
		§ 6.15.12	Added TM(18,150) format. As per ESOC-S18-222.
		§ 6.17.3	Added the meaning of setting subschedule ID to 0 (i.e. means all SSID) to TC(132,1), TC(132,2) and TC(132,6) as per ESOC-S132-226.

Issue	Date	Sections affected	Reason for change
		§ 6.19.1.5	Added TC(152,164) Perform Measurement format when sent by Ground as a position-tag TC through AVS TC(132,4) as per SYS CDR AI S1-CDR-OP111-018.
		§ 6.19.1.43	Updated TC(152,204).
		§ 8.1.2	Updated Table 8.1.2-2 to add two new TM packet categories used by the GPSR to enable the GPSR SW to deliver the TM packets based on priority and at the same time respect the Source Sequence Count order of delivery. An agreement between the Sentinels to resolve a GPSR SW CDR major discrepancy.
		§ 8.5	Changed RID assignment to GPSR as GPSR SW has used the range 5000 to 5999 decimal. Hence allocated GPSR the range 1300 to 17FF hex and the ASW the ranges 1000 to 12FF hex and 1800 to 1FFF hex.
		§ 8.6	Added a note to GPSR SID range assignment to indicate how to map the [RD.04] reported values to the S-1 SID value as per SYS CDR AI S1-CDR-OP117-088.
		§ 9.10	Modified description of "Mode" parameter of TC(12,148) and TC(12,149) as per ESOC-S12-277.
		§ 9.14	Service 19 parameters description updated to provide a clearer description of some parameters as per SYS CDR AI S1-CDR-OP77-131.
		§ 9.9	Added the meaning of SSID=0 (i.e. all SSID) to Subschedule ID definition for TC(11,1), TC(11,2) and TC(11,6) as per ESOC-S11-218.
06	30.03.11		All modifications with respect to issue 5 are shown with revision marks.
		§ 3.6	Added definition of "Orbit Number" and "Orbit Angle" as per ESOC-TC POS-240.
		§ 5.17.9	Added TC(160,11)
		§ 5.17.10	Added TC(161,14) TC(161,15) TC(161,81) TC(161,101) to TC(161,112)
		§ 5.17.12	Changed and added subtypes for the management of PDHT (i.e. TC(163,1) to TC(163,16)). Changed and added subtypes for the management of C-SAR (i.e. TC(163,21) to TC(163,36)). Added TC(163,41) to TM(163,56) for LCT management.
		§ 5.21.1	LCT service type number change from 248 to 240
		§ 5.21.2	LCT service type number change from 249 to 241
		§ 5.21.3	LCT service type number change from 250 to 242
		§ 5.21.4	LCT service type number change from 252 to 244

Issue	Date	Sections affected	Reason for change
		§ 5.21.5	LCT service type number change from 253 to 245
		§ 5.21.6	LCT service type number change from 254 to 246
		§ 5.21.7	LCT service type number change from 255 to 247
		§ 6.2.1	Added clarification note to TC(2,144) format on the two different CPDU commands. Response to ESOC-s2-289.
		§ 6.3.2	Added clarification note to TC(3,2) on Collection Interval, NREP and NPAR2 constraints imposed by ASW and ICM. Response to ESOC-s3-263.
		§ 6.3.10	Added a generic note applicable to all multiple TM packet reports
		§ 6.3.25	Added TC(3,240) format. Part of ESOC-s3-288.
		§ 6.3.26	Added TC(3,241) format. Part of ESOC-s3-288
		§ 6.6.3	Corrected TC(6,3) format where "Base ID" was erroneously shown not part of the block R1 repeated "N" times.
		§ 6.6.13	TC(6,149) format changes to align to implementation. Part of ESOC-s6-265
		§ 6.6.14	TC(6,150) format changes to align to implementation. Part of ESOC-s6-265
		§ 6.6.15	TM(6,151) format changes to align to implementation. Part of ESOC-s6-265
		§ 6.6.26	Added TC(6,240) format as per ESOC-s6-285.
		§ 6.7.1	LCT TC(8,1) description added and format aligned to that specified in SEN1-TESAT-LCT-SPE-15230. Part of ESOC-s8-286.
		§ 6.7.8	Added LCT TC(8,240) format. Part of ESOC-s8-286.
		§ 6.7.9	Added LCT TC(8,241) format. Part of ESOC-s8-286.
		§ 6.7.10	Added LCT TC(8,242) format. Part of ESOC-s8-286.
		§ 6.7.11	Added LCT TC(8,243) format. Part of ESOC-s8-286.
		§ 6.7.12	Added LCT TC(8,244) format. Part of ESOC-s8-286.
		§ 6.7.13	Added LCT TC(8,245) format. Part of ESOC-s8-286.
		§ 6.8.8	Added LCT TC(9,149) format
		§ 6.9.2	Clarified TC(11,2) format for case N1>0 and N2>0
		§ 6.9.6	Clarified TC(11,6) format for case N1>0
		§ 6.9.7	Clarified TC(11,144) format for case N1>0
		§ 6.9.13	Added Time Offset format of TC(11,15) as per ESOC-s11-258.
		§ 6.10.9	Clarified TM(12,11) format for case N_12_11 = 0.
		§ 6.10.19	Added clarification note to TM(12,153) on OOL value reporting. Response to ESOC-s12-256.

Issue	Date	Sections affected	Reason for change
		§ 6.10.25	TC(12,163) format corrected as per SES TMTC ICD - [RD.02] definition
		§ 6.10.21	Added clarification note to TM(12,155) on MDS status being reported in ASW HK periodic TM. Response to ESOC-s12-257.
		§ 6.15.16	Deleted NSTEPS = 0 of TM(18,164) as it is not valid.
		§ 6.16.5	Added case N = 0 for TM(19,7) format.
		§ 6.16.10	Corrected "First RID" to "First Event" in TC(19,146) as per ESOC-s19-278.
		§ 6.21	LCT service type numbers changed as per § 6.7.8 to § 6.7.13
		§ 6.21.6	Deleted LCT TC(246,1), TC(246,2), TC(246,3) and TC(246,9) which were required to update target trajectory parameters. Added LCT TC(246,12) as single command to update target trajectory parameters.
		§ 8.1.1	Added DSHA SW PID and LCT SW PID values.
		§ 8.3.1	Changed AVS Parameter Number range. Added LCT Parameter Number range.
		§ 8.3.2	Aligned ASW Parameter Number assignments to the ASW design.
		§ 8.3.5	Added LCT Parameter Number structure.
		§ 8.7	New section specifying dedicated SID to be associated to non-real time HK (i.e. PCAT = 8) as per ESOC-GEN-301.
		§ 9.3	Updated and added missing service 3 parameter descriptions
		§ 9.6	Added missing service 6 parameter descriptions and Memory ID types tagged as E. As per ESOC-s6-264. Also covers part of ESOC-s6-265
		§ 9.8	Added missing service 9 parameter description. The resolution of the PDHT time report added as per ESOC-s9-217.
		§ 9.9	Added some detail description of E and AT type parameters. Covers part of ESOC-s6-265
		§ 9.10	Updated definition of "Parameter Value" and "Limit Crossed" of TM(12,11) to cover the case when size is less than 32-bit as per ESOC-s12-255.
		§ 9.12	Updated some detail information on some AT type parameters. Covers part of ESOC-s6-265

Issue	Date	Sections affected	Reason for change
		§ 9.13	Added a clarification note to the OBOP ID description on the different use and assignment of OBOP ID between ICM and ASW. Response to ESOC-s18-266.
		§ 9.15	Section added for the definition of Service 130 parameters as per ESOC-PARDEF-227.
		§ 9.16	Section added for the definition of Service 131 parameters as per ESOC-PARDEF-227.
		§ 9.17	Section added for the definition of Service 132 parameters as per ESOC-PARDEF-227. Also covers part of ESOC-s6-265
		§ 9.18	Section added for the definition of Service 133 parameters as per ESOC-PARDEF-227.
		§ 9.19	Section added for the definition of Service 134 parameters as per ESOC-PARDEF-227.

6.9.12 TM (11, 13) Summary Time-Tagged Schedule Report	187
6.9.13 TC (11, 15) Time-Shift All Time-Tagged Telecommands.....	188
6.9.14 TC (11, 16) Report Time-Tagged TC Schedule in Detailed Form.....	188
6.9.15 TC (11, 17) Report Time-Tagged Command Schedule in Summary Form	189
6.9.16 TC (11, 18) Report Status of Time-Tagged Command Schedule	189
6.9.17 TM (11, 19) Time-Tagged TC Schedule Status Report.....	189

6.10	Service 12: On-Board Monitoring	190
6.10.1	TC (12, 1) Enable Monitoring of Parameters	190
6.10.2	TC (12, 2) Disable Monitoring of Parameters.....	191
6.10.3	TC (12, 225) Add Parameters to Monitoring List.....	192
6.10.4	TC (12, 6) Delete Parameters from Monitoring List	192
6.10.5	TC (12, 7) Modify Parameter Checking Information.....	193
6.10.6	TC (12, 8) Report Current Monitoring List.....	194
6.10.7	TM (12, 9) Current Monitoring List Report	194
6.10.8	TC (12, 10) Report Current Parameters Out-of-Limit List	195
6.10.9	TM (12, 11) Current Parameters Out-of-Limit List Report.....	195
6.10.10	TC (12, 144) Configure MDS Configuration Table	196
6.10.11	TC (12, 145) Configure MDS Status Table	197
6.10.12	TC (12, 146) Disable Monitoring Service	198
6.10.13	TC (12, 147) Enable Monitoring Service	198
6.10.14	TC (12, 148) Disable MDS.....	199
6.10.15	TC (12, 149) Enable MDS.....	199
6.10.16	TC (12, 150) Reset All HK Filter Counters	199
6.10.17	TC (12, 151) Reset All MDS Filter Counters	200
6.10.18	TC (12, 152) Reset Single HK Filter Counter	200
6.10.19	TM (12, 153) AVS Current Parameters Out-of-Limit List Report.....	201
6.10.20	TC (12, 154) Report MDS	201
6.10.21	TM (12, 155) MDS Report.....	202
6.10.22	TC (12, 160) Save Monitoring Configuration Data	202
6.10.23	TC (12, 161) Add Parameters to Monitoring List.....	203
6.10.24	TM (12, 162) Current Monitoring List Report	204
6.10.25	TC (12, 163) Modify Parameter Checking Information.....	205
6.10.26	TC (12, 227) Modify Parameter Checking Information.....	206
6.10.27	TM (12, 229) Current Monitoring List Report	208
6.11	Service 13: Large Data Transfer – Not Supported.....	208
6.12	Service 14: Packet Transmission Control.....	209
6.12.1	TC (14, 1) Enable Forwarding of TM Source Packets.....	209
6.12.2	TC (14, 2) Disable Forwarding of TM Source Packets.....	209
6.12.3	TC (14, 3) Report Disabled TM Source Packets	210
6.12.4	TM (14, 4) Disabled TM Source Packets Report	210
6.12.5	TC (14, 144) Enable Forwarding of HK Packets	211
6.12.6	TC (14, 145) Disable Forwarding of HK Packets	212
6.12.7	TC (14, 7) Report Disabled HK Packets	212
6.12.8	TM (14, 146) Disabled HK Packets Report.....	212
6.12.9	TC (14, 147) Enable Forwarding of Diagnostic Packets	213
6.12.10	TC (14, 148) Disable Forwarding of Diagnostic Packets.....	213
6.12.11	TC (14, 11) Report Disabled Diagnostic Packets.....	213
6.12.12	TM (14, 149) Disabled Diagnostic Packets Report	214
6.13	Service 15: On-Board Storage and Retrieval	214

6.13.1	TC (15, 1) Enable Storage in Packet Stores	214
6.13.2	TC (15, 2) Disable Storage in Packet Stores	215
6.13.3	TC (15, 3) Add Packets to Storage Selection Definition	215
6.13.4	TC (15, 4) Remove Packets from Storage Selection Definition	216
6.13.5	TC (15, 5) Report Storage Selection Definition	217
6.13.6	TM (15, 6) Storage Selection Definition Report	217
6.13.7	TC (15, 9) Downlink Packet Store Contents for Time Period	218
6.13.8	TC (15, 11) Delete Packet Stores Contents up to Specified Storage Time	219
6.13.9	TC (15, 12) Report Catalogues for Selected Packet Stores	219
6.13.10	TC (15, 128) Set the Nominal Read Pointer in a Packet Store	220
6.13.11	TC (15, 129) Delete Packet Store Contents up to Read Pointer	220
6.13.12	TC (15, 144) Set Packet Store Configuration	220
6.13.13	TC (15, 146) Suspend Packet Store Downlink	221
6.13.14	TC (15, 147) Resume Packet Store Downlink	222
6.13.15	TC (15, 148) Clear System Log Packet Store	222
6.13.16	TC (15, 149) Downlink Packet Store Contents for Packet Range	222
6.13.17	TM (15, 224) Packet Store Catalogue Report	224
6.13.18	TC (15, 226) Configure Packet Store	225
6.13.19	TC (15, 227) Store	225
6.13.20	TC (15, 228) Downlink	226
6.13.21	TC (15, 229) Pass Through Mode	227
6.13.22	TC (15, 230) Perform E2E BITE	228
6.13.23	TC (15, 231) Perform Memory TEST	228
6.13.24	TC (15, 232) Abort	229
6.13.25	TC (15, 233) Set Nominal Read Pointer of Packet Store	229
6.13.26	TC (15, 234) Delete Packet Store Contents up to Read Pointer	230
6.14	Service 17: Connection Test	230
6.14.1	TC (17, 1) Perform Connection Test	230
6.14.2	TM (17, 2) Connection Test Report	230
6.15	Service 18: On-board Operations procedure Service	231
6.15.1	TC (18, 144) Add / Modify OBOP	231
6.15.2	TC (18, 160) Add Telecommand to OBOP	231
6.15.3	TC (18, 2) Delete Procedure	232
6.15.4	TC (18, 3) Start Procedure	232
6.15.5	TC (18, 4) Stop Procedure	233
6.15.6	TC (18, 162) Report List of Onboard Operation Procedure	233
6.15.7	TC (18, 145) Report List of OBOP with Status	233
6.15.8	TM (18, 146) OBOP List and Status Report	234
6.15.9	TM (18, 163) List Of Onboard Operations Procedures Report	235
6.15.10	TC (18, 130) Report OBOP Detailed Definition	235
6.15.11	TC (18, 149) OBOP Flow Control	235
6.15.12	TM (18, 150) AVS OBOP Definition Report	236
6.15.13	TC (18, 151) OBOP Termination	236
6.15.14	TC (18, 147) Enable OBOP	237

6.15.15 TC (18, 148) Disable OBOP	237
6.15.16 TM (18, 164) SES OBOP Definition Report	238
6.15.17 TC (18, 10) Report List of Active Onboard Operations Procedures	238
6.15.18 TM (18, 11) Onboard Active Operations Procedures List Report.....	239
6.15.19 TC (18, 161) Save OBOP Configuration Data	239
6.16 Service 19: Event Detection and Action Execution.....	240
6.16.1 TC (19, 2) Delete Events from the Detection List.....	240
6.16.2 TC (19, 4) Enable Actions	240
6.16.3 TC (19, 5) Disable Actions	240
6.16.4 TC (19, 6) Report the Event Detection List	241
6.16.5 TM (19, 7) Event Detection List Report.....	241
6.16.6 TC (19, 128) Report Event Action	242
6.16.7 TM (19, 129) Event Action Report.....	242
6.16.8 TC (19, 144) Configure RID-Event Table Event Fields	243
6.16.9 TC (19, 145) Configure RID-Event Table Enable/Disable Fields	243
6.16.10 TC (19, 146) Configure Event-Action Table Parameter Fields	244
6.16.11 TC (19, 147) Configure Event-Action Table Enable/Disable Fields.....	244
6.16.12 TC (19, 148) Report RID-Event Table Configuration	245
6.16.13 TM (19, 149) RID-Event Table Configuration Report.....	245
6.16.14 TC (19, 150) Report RID-Event Table Status	246
6.16.15 TM (19, 151) RID-Event Table Status Report.....	246
6.16.16 TC (19, 152) Report Event-Action Table Configuration.....	247
6.16.17 TM (19, 153) Event-Action Table Configuration Report	247
6.16.18 TC (19, 154) Report Event-Action Table Status.....	248
6.16.19 TM (19, 155) Event-Action Table Status Report	249
6.16.20 TC (19, 156) Enable Event-Action Service	249
6.16.21 TC (19, 157) Disable Event-Action Service.....	250
6.16.22 TC (19, 160) Add Events to the Detection List.....	250
6.16.23 TC (19, 161) Save Event Detection List Configuration Data	250
6.17 ASW Mission Specific Services	251
6.17.1 Service 130: Command Database Management Service	251
6.17.1.1 TC (130,1) Insert Telecommand.....	251
6.17.1.2 TC (130,2) Reset Spare OBCD Section	251
6.17.1.3 TC (130,3) Report Free Available Space.....	252
6.17.1.4 TM (130,4) Free Available Space Report	252
6.17.1.5 TC (130,5) Dump OBCD Telecommand.....	252
6.17.1.6 TM (130,6) Dump OBCD Telecommand Report.....	252
6.17.1.7 TC (130,7) Execute Telecommand.....	253
6.17.1.8 TC (130,8) Enable OBCD Telecommand	253
6.17.1.9 TC (130,9) Disable OBCD Telecommand	254
6.17.1.10 TC (130,10) Modify OBCD Telecommand.....	254
6.17.2 Service 131: Orbit Management Service	255
6.17.2.1 TC (131,1) Set Orbit Number	255
6.17.2.2 TC (131,2) Report Orbit Number	255

6.17.2.3	TM (131,3) Orbit Number Report.....	255
6.17.3	Service 132: Onboard Position-Tag Command Schedule.....	256
6.17.3.1	TC (132,1) Enable Release of Position-Tagged Telecommands.....	256
6.17.3.2	TC (132,2) Disable Release of Position-Tagged Telecommands.....	257
6.17.3.3	TC (132,3) Reset Position-Tagged Command Schedule.....	257
6.17.3.4	TC (132,4) Insert Position-Tagged Telecommands in Command Schedule.....	258
6.17.3.5	TC (132,5) Delete Position-Tagged Telecommands.....	258
6.17.3.6	TC (132,6) Delete Position-Tagged TC over Position Interval and Sub-Schedule	258
6.17.3.7	TC (132, 144) Delete PT-TC over Position Interval and PID	259
6.17.3.8	TM (132,10) Detailed Position-Tagged Command Schedule Report.....	259
6.17.3.9	TM (132,13) Summary Position-Tagged Schedule Report	260
6.17.3.10	TC (132,16) Report Position-Tagged Command Schedule in Detailed Form	260
6.17.3.11	TC (132,17) Report Position-Tagged Command Schedule in Summary Form	261
6.17.3.12	TC (132,18) Report Status of Position-Tagged Command Schedule	261
6.17.3.13	TM (132,19) Position-Tagged Command Schedule Status Report.....	262
6.17.4	Service 133: Two-Step Telecommand Service	262
6.17.4.1	TC (133,1) Arm Telecommand	262
6.17.4.2	TC (133,2) Download Armed Telecommand	263
6.17.4.3	TM (133,3) Armed Telecommand Report	263
6.17.4.4	TC (133,4) Delete Armed Telecommand	264
6.17.4.5	TC (133,5) Fire Telecommand	264
6.17.5	Service 134: Telecommand Batch Management Service	264

1 INTRODUCTION

1.1 SCOPE

This document provides the Sentinel-1 Space Segment Specific Packet Utilization Standard services and related interfaces with the Ground Segment.

The detailed implementation of the telecommand and telemetry packets will be defined in the satellite data base

1.2 CONVENTIONS

1.2.1 Services Numbering Convention

Service class and function is provided by Service type and Service subtype, included in the data field header of the packet.

To make identification simpler, Service Type and Service Sub-Type are represented by two numbers, separated by a comma.

- For Telecommand: TC (Service Type number, Service Sub-Type number),
- For Telemetry: TM (Service Type number, Service Sub-Type number).

As an example:

- TC (1,1) is a telecommand packet type 1, subtype 1
- and TM (1,2) is a telemetry packet type 1, subtype 2.

Subtype numbers within a service are unique.

1.2.2 1553B Bus Data Transfer Convention

The relationships between processor memory location (least significant word (LSW) to most significant word (MSW)) and word bit assignments (least significant bit (LSB) to most significant bit (MSB)) as they relate to word order and bit order on the S/C Data Bus is reported below.

1553B Bus Word Order:

1553B Bus Bit Order:

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	
Sync Bits			Data Word Bits																	Parity Bit

Corresponding HW Data Bit Relationships:

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	MSB																LSB

Figure 1.2.2-1: S/C Data Bus - Data Convention

The first data word on the 1553B Bus is the lowest word in memory. That is, the LSW in Figure 1.2.2-1 will be the first data word on the bus. In the RT memory, it will be written to the lowest location (address) allocated for that data. Likewise, the MSW will be the last data word on the bus and will appear in the RT memory in the highest location (address) allocated for that data. The rest of the words on the bus and in RT memory will be in consecutive order.

As shown in Figure 1.2.2-1, the first bit of the data word on the bus is the most significant bit (MSB). The least significant bit (LSB) comes just before the parity bit. The 1553B command word, which is used for control, should not be confused with spacecraft commands that are sent as 1553B data words (up to 32 per message).

1.2.3 TM & TC Packet Layout Convention

The general layout used for the definitions of individual telecommand and telemetry packets are shown in Figure 1.2.3-1 and Figure 1.2.3-2 respectively. The details of the Packet Header is omitted while the Data Field Header is simplified showing only the values of the Service Type and Service Subtype numbers. The main focus is on the relevant Application Data field structure of the telecommand packet and the Source Data field structure of the telemetry packet.

For readability reasons the message parameters are shown in a list format to provide equal space to each parameter regardless of its actual size. The parameter position in the message is given by the word number on the left, while the parameter size is given on the right.

The list format has the parameters of a packet in order from most-significant (MS) to least-significant (LS) where Word 1 is the MS-word of the packet.

The parameter is left-justified, that is, stacked on the most significant side of the word.

As example, a series of bit fields described as:

11	Status	1 bit
11	Spare = 0	4 bits
11	Sub-Schedule ID	11 bits

Is mapped as:

	MSB															Word 11				LSB				
Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15								
	Status		Spare				Sub-Schedule ID																	

Also the data is right aligned within any TM or TC data field. As example, Sub-Schedule ID = 2 would be (MSB) 00000000010 (LSB) where the MSB is the first bit transmitted.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (Type, Subtype)	2 words
	Application Data	variable
M	Packet Error Control	1 word

Figure 1.2.3-1: Telecommand Packet General Layout

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (Type, Subtype)	5 words
	Source Data	variable
M	Packet Error Control	1 word

Figure 1.2.3-2: Telemetry Packet General Layout

1.3 DEFINITIONS

Application Process	Usually an application process can be associated with a subsystem or instrument. An application process can receive TC packets and/or generate TM packets
Application Data	Data destined to an on-board application process, encapsulated in a TC packet.
Application ID	An 11 bits field. The Application Process ID (APID) is divided into Process ID (PID - first 7 bits) and Packet Category (PCAT - last 4 bits). The APID of a TM packet identifies the application process, which generated the packet. The APID of a TC packet identifies the application process, which will receive the packet. An APID is unique across the system
Channel	Physical input or output line(s).
Packet Category	Packet Category (PCAT) is a 4-bit field. The PCAT identifies different categories of TM packets which Ground typically processes in different ways and for which separate accounting (i.e. source sequence counts) is required to be kept. The PCAT for TC are not used and set to a fixed value.
Packet Terminal	On-board user, which decodes TC packets and encodes TM packets.
Non-Packet Terminal	On-board user, which does not decode TC packets or encode TM packets.
Parameter ID	That uniquely identifies a parameter across the system. The same PID may not be used by different APID
Process ID	Process ID (PID) is a 7-bit field and together with the Packet Category (PCAT) form the Application Process ID (APID). The PID forms a base address which identifies the process to which the TC packet is addressed or generating the TM packet.
SID Structure Identifier	defines the structure of the parameter field in the packet. The same SID may be used by different APID
Source Data	Data generated by an on-board application process, encapsulated in a TM packet

1.4 LIST OF ACRONYMS AND ABBREVIATIONS

The Sentinel-1 acronyms are reported in [RD.01]. For reader convenience, acronyms used in this document are also listed below.

ASW	Avionics Onboard Software (resident and executed by the SMU PM)
AVS	Avionics Subsystem
BOL	Beginning Of Life
bps	bit per second
CCSDS	Consultative Committee for Space Data Systems
CLTU	Command Link Transmission Unit
CLCW	Command Link Control Word
COTS	Commercial Off The Shelf
CSCI	Computer Software Configuration Item
EOL	End Of Life
FAR	Frame Analysis Report
FDIR	Failure Detection Isolation and Recovery
GPS	Global Position System
GSE	Ground Support Equipment
HK	House Keeping
HL	High Level
HW	Hardware
I/F	Interface
LSB	Least Significant Bit
MSB	Most Significant Bit
OBS	On-Board Software
P/F	Platform
P/L	Payload
PM	Processor Module (SMU core module)
PROM	Programmable Read Only Memory
QA	Quality Assurance
RAM	Random Access Memory
RS	Reed Solomon
S/C	Spacecraft
S/L	Satellite
S/S	Subsystem
SMU	Spacecraft Management Unit
SSU	Spacecraft Security Unit
SW	Software
TBC	To Be Confirmed
TBD	To Be Defined
TC	Telecommand
TX	Transmitter
VCDU	Virtual Channel Data Unit

2 DOCUMENTATION

2.1 PARENT DOCUMENTS

The Sentinel-1 Specific PUS services and functions are in line with the following parent documents requirements. Any deviations are justified in this document.

- [PD 01] GMES Sentinel-1 System Requirements Document (SRD)
S1-RS-ESA-SY-0001
- [PD 02] GMES Sentinel-1 Operational Interface Requirements Document (OIRD)
S1-RS-ESA-SY-0006

2.2 NORMATIVE DOCUMENTS

2.2.1 Sentinel-1 Applicable Documents

- [AD.01] Command & Control Specification for Avionics S/S - **Only Applicable to AVS**
S1-RS-TASI-SC-0092
- [AD.02] Command & Control Specification for C-SAR Instrument - **Only Applicable to C-SAR**
S1-RS-TASI-SC-0071
- [AD.03] Command & Control Specification for PDHT S/S - **Only Applicable to PDHT**
S1-RS-TASI-SC-0093
- [AD.04] LCT Req Spec Volume 4: LCT Command & Control - **Only Applicable to LCT**
S1-RS-TASI-SC-0169 Volume 4

2.2.2 Applicable Standards

The following documents are applicable standards:

- [AS.01] Telemetry and Telecommand Packet Utilization Standard (PUS)
ECSS-E-70-41A
- [AS.02] Digital Time Division Command/Response Multiplex Data Bus Standard
MIL-STD-1553B Notice 4
- [AS.03] Packet Telecommand Standard
ESA PSS-04-107
- [AS.04] Packet Telemetry Standard
ESA PSS-04-106

2.3 REFERENCE DOCUMENTS

3 TELECOMMAND STRUCTURE

3.1 TC TRANSFER FRAME

The TC Transfer Frame shall conform to the structure defined in [AS.03]. The TC Transfer Frame structure is shown in Figure 3.1-1 below.

TC Frame Header								TC Frame Data	TC Frame Error Control
Version Number	Bypass Flag	Control Command Flag	Spare	Spacecraft ID	Virtual Channel ID	Frame Length	Frame Sequence Number		
2	1	1	2	10	6	10	8	Max 249 bytes	2 bytes
2 bytes				2 bytes		1 byte			

Figure 3.1-1 TC Transfer Frame Structure

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be set to 0 for all
Bypass Flag	Defines usage of sequence control mechanism	0 = sequence control is used (type A) 1 = sequence control not used (type B)
Control Command Flag	Defines the type of the transfer frame	0 = Data Frame (i.e. AD or BD Frame) 1 = Control Frame (i.e. BC Frame containing control command)
Spare		Must be set to 0
Spacecraft ID	Sentinel-1 S/C ID	EQM: 3FF Hex Sentinel-1A PFM: 22B Hex Sentinel-1B FM2: 22D Hex
Virtual Channel ID	Identification of the S/C Telecommand chain.	0 = decoder 1 7 = decoder 2
Frame Length	Number of bytes in that frame minus 1	Min 7 (5 byte header + 1 byte in the data field + 2 byte error control - 1) Max 255 (5 byte header + 249 byte in the data field + 2 byte error control - 1)
Frame Sequence Number	Denoted as N(S) is set to different values depending on the type of Transfer Frame.	For AD Transfer Frames: Set to FOP V(S) – refer to [AS.03]. For BC and BD Transfer Frames: Set to all zeros.

PARAMETER	DESCRIPTION	RANGE OR VALUE
TC Frame Data	Contains a TC Segment.	Refer to section 3.2 for the structure of the TC Segment.
TC Frame Error Control	A Frame Check Sequence as specified in [AS.03]	0 to $2^{16} - 1$

3.2 TC SEGMENT

The TC Segment shall conform to the structure defined in [AS.03]. The TC Segment structure is shown below.

Segment Header		Segment Data	
Sequence Flag	MAP ID	Segment Data Field	Authentication Tail
2 bit	6 bit		
1 byte		Max 226 bytes	22 bytes

Figure 3.2-1 TC Segment Structure

The TC Segment is routed according to the value of the MAP ID.

Refer to [RD.08] section 3.1 for the command uplink routing and in particularly Figure 3-2 in [RD.08] where the MAP routing and cross-strapping is illustrated.

The MAP ID is used to address the SMU Processor Module (MAP 2 and MAP 3); TC Decoder (MAP 4 and MAP 5); TC Command Pulse Distribution Unit (CPDU) (MAP 0); RM SGM (MAP 6 and MAP 8); RM CPDU (MAP 7 and MAP 9) and AU (MAP 63) for AU control TCs. TC Segments which address the TC Decoder, AU, TC CPDU, RM SGM, RM CPDU are executed without involvement of the SMU resident software, referred to as the Avionics SW (ASW).

PARAMETER	DESCRIPTION	RANGE OR VALUE
Sequence Flag	Used by segmentation protocol to indicate the sequential position of the segment relative to the complete TC Packet. Only the TCs to the SMU PM support segmentation while the TCs to the TC Decoder (i.e. Control TCs), HPC CPDU, RM CPDU, TRM SGM and AU Control TCs cannot be segmented. Note: Max TC Packet size supported by AVS is 512 bytes which requires three TC Segments to uplink a max TC packet size. The segmented TC packet is re-assembled and verified by the ASW and the re-assembled TC packet process is transparent to the addressed PID.	01: First segment 00: Continuation segment 10: Last segment 11: Un-segmented

PARAMETER	DESCRIPTION	RANGE OR VALUE
MAP ID	Multiplexed Access Point Identifier	MAP 0: CPDU MAP 1: reserved. MAP 2: local PM (i.e. to ASW). MAP 3: partner PM. MAP 4: TC Decoder control command MAP 5: TC Decoder control command MAP 6: local RM SGM MAP 7: local RM CPDU MAP 8: partner RM SGM MAP 9: partner RM CPDU MAP 63: AU control commands
Segment Data Field	Contains either a complete TC Packet or part of a TC Packet. The max size TC Segment Data field is 226 bytes. The max size limit is established with AU in Secure Mode. For simplicity, the max limit is also maintained when in Clear Mode where no AU Tail must be present for Normal TC (i.e. not AU control TC).	
AU Tail	Composed of Key ID, LAC anti-replay and message authentication code (MAC). Refer to Figure 3.2-2 below. AU Tail is present in all TC Segments when commanding in Secure mode. The AU Tail must not be present on Normal TC when commanding in Clear Mode. AU control TCs always have an AU Tail in either AU Secure or Clear Mode.	

The supported authentication technique is a "plain-text-with-appended-MAC" system. It consists of appending a digital MAC (Message Authentication Code) at the end of the TC Segment. The MAC is a 16-octet value generated from a secret key, the TC Segment and a LAC Counter value. The onboard Authentication Unit regenerates the MAC for the received TC Segment, and the command is only accepted if the two MACs match. Three different LAC Counters are supported for anti-replay protection, one for each type of command (i.e. Normal, Control and Recovery).

For Normal commands the AU function operates in two different modes, Secure or Clear mode. In Secure mode all Normal commands are processed by the authentication function, and if accepted, routed to the segment distribution, while in Clear mode all normal commands by-pass the authentication function. The AU function is configured via AU control commands which are always authenticated and can be sent to the AU independently of the AU mode.

The MAP ID in the TC Segment is used to separate the AU Control commands from the Normal commands.

The Authentication Unit uses two different types of keys: Master keys and Session keys. Session keys are used for authentication of all Normal commands and AU Control commands. Master keys are used for decryption of encrypted session keys in sessionkey upload commands. Also Master keys are used for authentication of commands to the AU function in emergency situations where the master key is referred to as a Recovery key. Hence AU Control commands can be authenticated using either Session keys or Master keys.

THALES

All rights reserved, 2007, Thales Alenia Space

100181547K-EN

The AU supports 1024 Master keys and 4096 Session keys. The Session keys can be reprogrammed by the use of a dedicated upload session key command.

Refer to [RD.08] for detailed information on the AU function including operational aspects. Figure 3.2-2 below shows the TC Segment AU Tail structure.

Key Info Field		Logical Authentication Channel (LAC)		Message Authentication Code
Key Type	Reserved	Reserved	LAC Counter	MAC
1 bit	15 bits	2 bits	30 bits 22 octets	128 bits

Figure 3.2-2 AU Tail Structure

PARAMETER	DESCRIPTION	RANGE OR VALUE
Key Type flag	Defines in conjunction with the MAP ID the Authentication Key to be used by the Authentication Processor. Note: The MAP ID is used to determine if the processed command is a normal command or an AU control command. The Authentication Key (KeyID) in use is enabled by a dedicated control command (Activate New Authentication Key). Refer to RD[07] for a more detailed description.	0: Session Key 1: Master Key
'Reserved' field of Key Info	No checks are performed onboard on these bits. Recommended to be set to zero.	Set to zero.
'Reserved' field of LAC	Not used	Set to zero.
LAC Counter	A LAC counter is used to associate every TC Segment with an authentication sequence number, to ensure that identical TC Segments will not produce the same MAC (except at large intervals of time). On-board the selected LAC counter is set to the received value plus one every time a TC Segment is successfully authenticated. A positive sliding window for the LAC counters is supported. The width of the window is set by a dedicated control command. It allows a TC segment to be accepted as long as the LAC value in the tail is within the current window for the addressed LAC counter in the AU. Three LAC counters are provided (i.e. Normal, Control and Recovery).	
MAC	Message Authentication Code is computed using an algorithm called CMAC. Refer to [RD.08] section 4.4.1 for more detailed information.	

3.3 CPDU TELECOMMAND

TC CPDU:

The TC CPDU function is implemented in hardware and integrated in an ASIC. Once the TC CPDU function receives a TC Packet compliant to the CPDU TC format it will start the execution of the HPC instructions which includes generation a pulse of duration equal to that specified in the instruction, then it moves on to the next instruction until it completes all instructions. The total duration is roughly the sum of all the pulse durations. The delay between completion of one instruction and the start of the next instruction is relatively short compared to the pulse duration. The TC CPDU contains a timer to ensure that all pulses terminate. If the pulse timer expires, the CPDU will immediately stop the ongoing pulse output. The TC CPDU TC Packet execution will stop with an error and the remaining command instructions will not be executed. A pulse duration ranges from D to 128.D where D is set to 15 ms.

The execution time of a HPC CPDU packet can be calculated from the following formula:

$$ExecutionTime = 4 + \sum_{i=1}^N P_i * D + (N - 1) * d \quad ms$$

where:

- N is the number of pulses to execute
- P_i is the commanded pulse length factor for command (i.e. 2^L where $0 \leq L \leq 7$)
- D is the duration parameter which is set to 15 ms
- d is the delay between commands which is set to 5.9 ms

The total execution time must not exceed 16 s (PROM configurable value).

The TC CPDU may receive TC segments containing a CPDU packet from three sources:

- TC Decoder (i.e. Ground)
- Reconfiguration Module
- Active Processor Module (i.e. ASW)

The requests are prioritised such that the Reconfiguration Module requests always have the highest priority. The Processor Module requests always have the lowest priority.

Refer to [RD.08] for more information on TC CPDU command function including selection, priority and Ground override capability through Set TC Only command.

The TC CPDU TC Packet format is shown in Figure 3.3-1. The TC Packet has a minimum length of 10 bytes and a maximum length equal to 226 bytes as CPDU TCs cannot be segmented and the max TC Segment Data field size is applicable.

The Application Data of the CPDU consist of at least one HPC instruction or several HPC instructions up to the maximum allowed. When there are more than one HPC instruction in the Packet, each instruction is executed one after the other, in the original sequence.

Ground is able to predict the duration of the CPDU TC Packet execution from the specified number of HPC instructions and the specified Pulse Time parameter.

The AVS Software (ASW) supports TC (2,144) Distribute CPDU TC Packet(s) which allows Ground to Time-Tag or Position-tag HPC commands through TC (11,4) and TC (132,4) respectively.

The format of the HPC Instruction is shown in Figure 3.3-2.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	Word
Packet Header (48-bits)	VN		T	DFH = 0	APID											1	
	SF		Sequence Count													2	
	Packet Length															3	
	HPC Instruction 1															4	
	HPC Instruction 2															5	
	:															:	
	:															:	
	:															:	
	HPC Instruction M															N-1	
	Packet Error Control															N	

Figure 3.3-1: CPDU TC Packet Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be 000
Type	Packet type (0 = telemetry, 1 = telecommand)	Must be 1
APID		TC-1 CPDU APID: 021 H TC-2 CPDU APID: 022 H
Data Field Header (DFH) flag	Indicates the presence of a data field header (when set to 1)	Must be 0
Sequence Flag (SF)	Only stand-alone packets are supported	Must be set to 11
Sequence Count	Wrap around counter used to count each TC packet from a certain APID. Not verified by CPDU, only reported in CPDU Status Report to indicate last TC Packet successfully processed.	0 to $2^{14} - 1$,
Packet Length	Number of bytes contained in the packet data field minus 1	Max CPDU TC packet size is 226 bytes which is linked to the maximum TC Segment Data Field size. Hence M = 109 HPC max
HPC Instruction	The format is shown in Figure 3.3-2.	
Packet Error Control (PEC)	The PEC is a CRC used by the CPDU to verify the integrity of the complete TC packet. After initialising the encoder to all ones, it is generated over the entire CPDU Packet (except the Packet Error Control field) using the polynomial $g(x) = x^{16} + x^{12} + x^5 + 1$	0 to $2^{16} - 1$

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
HPC ID								Spare = 00000				Pulse Time				

Figure 3.3-2: HPC Instruction Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
HPC ID	Specifies HPC channel	0 to 255
Pulse Time	Specifies the duration of the Command Pulse to be issued.	000 = 1 x D, where D (Duration) is a fixed value which will be in the range 10 to 15 ms. D is set to 15 ms. 001 = 2 x D 010 = 4 x D 011 = 8 x D 100 = 16 x D 101 = 32 x D 110 = 64 x D 111 = 128 x D

RM CPDU:

The RM CPDU TC Packet format is shown in Figure 3.3-3, note that it has the same format as the TC CPDU TC Packet. The format of the HPC Instruction is shown in Figure 3.3-4.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	Word

	HPC Instruction 2																5
	:																:
	:																:
	:																:
	HPC Instruction M																N-1
	Packet Error Control																N

Figure 3.3-3: RM CPDU TC Packet Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be 000
Type	Packet type (0 = telemetry, 1 = telecommand)	Must be 1
Data Filed Header (DFH) flag	Indicates the presence of a data filed header (when set to 1)	Must be 0
APID	Application Process ID	RM-1 CPDU APID = 031 H RM-2 CPDU APID = 032 H
Sequence Flag (SF)	Only stand-alone packets are supported	Must be set to 11
Sequence Count	Wrap around counter used to count each TC packet from a certain APID. Not verified by CPDU, only reported in CPDU Status Report accessible by ASW to indicate last TC Packet successfully processed.	0 to $2^{14} - 1$,
Packet Length	Number of bytes contained in the packet data field minus 1	Max RM CPDU TC packet size is 32 bytes provides 12 HPC Instruction capability (i.e. M = 12 max.).
HPC Instruction	The format is shown in Figure 3.3-4.	
Packet Error Control (PEC)	Provides an error detection code used by the CPDU to verify the integrity of the complete TC packet.	0 to $2^{16} - 1$

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
HPC ID								Spare = 00000				Pulse Time				

Figure 3.3-4: HPC Instruction Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
HPC ID	Specifies HPC channel	0 to 256
Pulse Time	Specifies the duration of the Command Pulse to be issued.	Don't care. HPC are internally used by RM to configure RM status.

RM Memory Load:

The RM Memory Load TC Packet enable Ground to write in the RM SGM. The format of the TC packet shall be as shown in Figure 3.3-5.

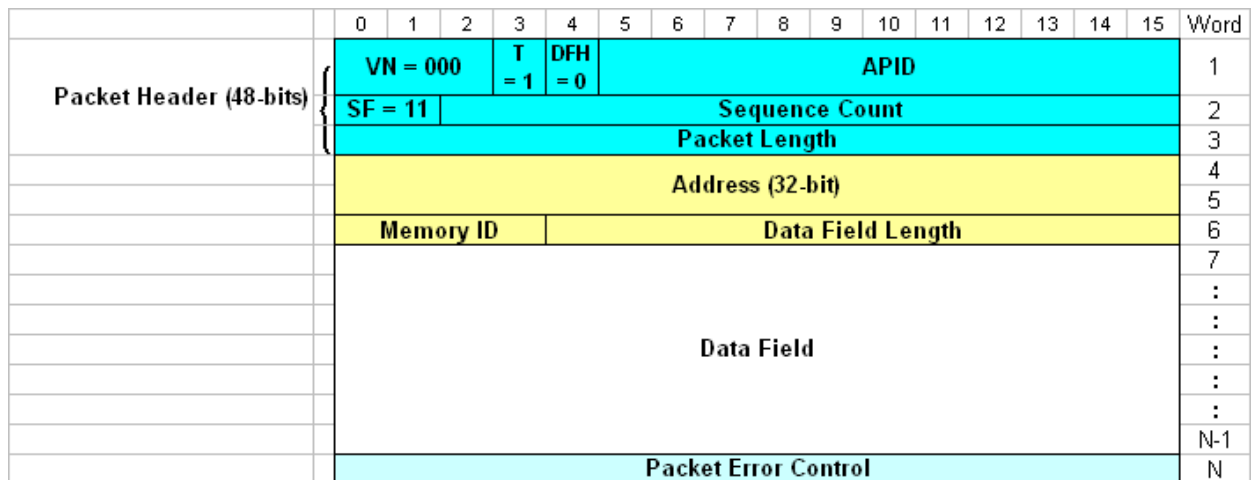

Figure 3.3-5: RM Memory Load TC Packet Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be 000
Type	Packet type (0 = telemetry, 1 = telecommand)	Must be 1
Data Filed Header (DFH) flag	Indicates the presence of a data filed header (when set to 1)	Must be 0
APID	Application Process ID	RM-1 SGM APID = 041 H RM-2 SGM APID = 042 H
Sequence Flag (SF)	Only stand-alone packets are supported	Must be set to 11
Sequence Count	Wrap around counter used to count each TC packet from a certain APID. Not verified by RM, only reported in RM Status Report accessible by ASW to indicate last RM TC Packet successfully processed.	0 to $2^{14} - 1$,
Packet Length	Number of bytes contained in the packet data field minus 1	Max RM TC packet size is 224 bytes which is linked to the maximum TC Segment Data Field size.
Address	Address of the memory load operation. Represents the start address for a multiple data load	32-bit address.
Data Field Length	Length of the data to be loaded expressed in byte.	12-bit field. Max Data Field size is 210 bytes.
Memory ID	Identifies the memory	4-bit field. 0000 – Dynamic Data Base memory (no Ground

PARAMETER	DESCRIPTION	RANGE OR VALUE
		access) 1111 – Static Data Base memory
Data Field	The data to be loaded which is 16-bit word aligned. If byte load is required, then a dummy byte could be required.	
Packet Error Control (PEC)	Provides an error detection code used by the CPDU to verify the integrity of the complete TC packet.	0 to $2^{16} - 1$

3.4 TC PACKET

Sentinel-1 general TC Packet format is shown in Figure 3.4-1. It conforms to the structure defined in [AS.03].

All TC Packets contain the Sentinel-1 standard Packet Data Field Header derived from the PUS, [AS.01], except for the TC Packets addressed to the SMU TC Command Pulse Distribution Unit (CPDU), SMU RM CPDU, SMU Authentication Unit (AU) and SMU RM Safe Guard Memory (SGM).

AVS manages all S/C TC packets uplinked by Ground. The max AVS TC packet size processed by the ASW is 512 bytes which corresponds to ASW TC buffer size.

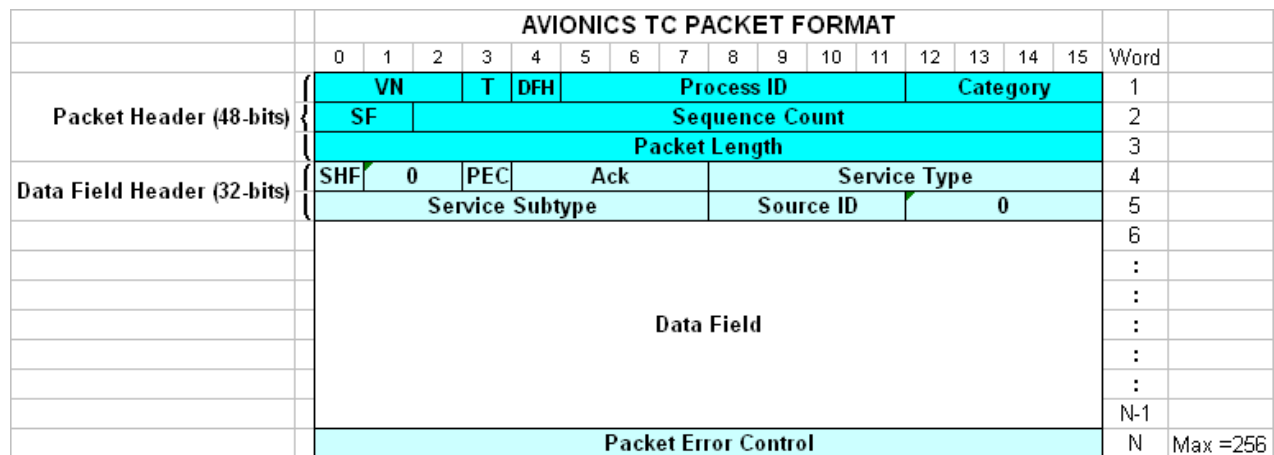

Figure 3.4-1 TC Packet Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be set to 0 for all commands
Type	Packet type (0 = telemetry, 1 = telecommand)	Must be set to 1 for all telecommands
Data Field Header (DFH)	Indicates the presence of a	Must be set to 1 for all telecommands addressed

PARAMETER	DESCRIPTION	RANGE OR VALUE
flag	data field header (when set to 1)	to SMU PM (MAP 2 and 3) and all AU Control commands (MAP 63). Must be set to 0 for TC CPDU, RM CPDU and RM SGM commands.
Process ID (PID)	The application process which is the destination of the TC packet. Used on-board for routing the TC packet.	Refer to Table 8.1.1-1 (section 8.1.1)
Packet Category (PCAT)	The PCAT for TC have a fixed value	Refer to Table 8.1.2-1 (section 8.1.2)
Sequence Flag (SF)	Only stand-alone packets are supported	Must be set to 11 _{bin} (stand alone TC packet)
Sequence Count	Wrap around counter used to count each TC packet from a certain APID. For each APID a separate Sequence Counter is maintained.	0 to $2^{14} - 1$
Packet Length	Number of bytes contained in the packet data field minus 1	Max AVS TC packet size is 512 bytes. Max TC packet size is driven by the AVS (Note: Same size used on TASI heritage missions.) C-SAR, PDHT and GPS TC packets maximum size is 492 bytes in order to be compatible with TC (11,4) and TC (132,4). Minimum size of TC packets is 12 bytes with PEC and 10 bytes without PEC (Note: Onboard stored TC (i.e. TCs stored in the ASW OBCD) have no PEC).
CCSDS Secondary Header Flag (SHF)	As required by CCSDS 203.1 -- B -- 1	This field indicates that the PUS data field header is a "non-CCSDS defined secondary header" and shall be set to 0
PEC Flag	Indicates the presence of the PEC field	0 = No PEC field 1 = PEC field.

PARAMETER	DESCRIPTION	RANGE OR VALUE
Telecommand Acknowledgements (ACK)	This field is used to indicate which acknowledgement, in the form of telecommand verification packets, must be sent to Ground to notify acceptance and to verify execution (this relates only to positive acknowledgements, as the negative ones are generated by default)	0000: No positive acknowledgement must be sent ***1: TC acceptance packet must be sent **1*: TC execution start packet must be sent *1**: TC execution progress packet must be sent 1***: TC execution completion packet must be sent
Service Type	Indicates the service to which the packet relates	1 to 19 Standard PUS Service Types 128 to 255 S-1 Specific Service Types
Service Subtype	Indicates the service subtype to which the packet relates	1 to 26 Standard PUS Service Subtypes 128 to 255 S-1 Specific Service Subtypes
Source ID	Identification of the command source issuing the TC packet	Refer to Table 8.2-1 (section 8.2)
Spare		Set to 0000
Data Field		Contents and length linked to PUS service type and subtype pair.
Packet Error Control (PEC)	The PEC field provides an error detection code that is used by the receiving application process to verify the integrity of the complete TC packet. The PEC is a CRC as specified in [AS.01] Annex A1. Note: On-board generated TC have no PEC field.	0 to $2^{16} - 1$

3.5 AVS TC (11, 4) PACKET: INSERT TC IN TIME-TAGGED SCHEDULE

AVS TC (11,4) telecommand is used for the upload of all S/C time-tagged telecommands. The format of AVS TC (11,4) is shown in Figure 3.5-1. As shown, TC (11,4) is capable to hold more than one TT-TC. The format of the Time Tag field is shown in Figure 3.5-2.

AV TC (11,4) PACKET: INSERT TT-TC IN COMMAND SCHEDULE

Figure 3.6-2: Position Tag Field Format

The constraints applicable to TC (132,4) are:

- (b) All Position Tag TC within a TC (132.4) must have the same sub-schedule ID.
- (b) The Position Tag TC within a TC (132.4) must be "position" ordered.

PARAMETER	DESCRIPTION	RANGE OR VALUE
Packet Header	Refer to section 3.4	
Data Field Header	Refer to section 3.4	
Sub-schedule ID	Provides Ground the capability to group a sequence of commands addressing different PID and linked to a specific operation together via the sub-schedule ID field. Commands with the same sub-schedule ID are able to be manipulated by Ground while in the MTL command schedule without impact on the rest of MTL commands in the queue. NOTE: If the PT-TC is disabled (e.g. the sub-schedule including the PT-TC in question is disabled) and the PT-TC expires, then only the expired PT-TC shall be deleted.	
N° of TC Packets	Specifies the number of TT-TC embedded in the TC (132,4).	1 to P The only constraint is the maximum size limit of the TC packet (i.e. 256 words)
Orbit Number	The on board orbit number "n" which is a continuous unsigned 16-bit counter (more than 11 years wrap-around)	
Orbit Angle	Anomaly w.r.t the [TOD] ascending node α having 2^{-23} degrees resolution.	

3.7 AVS TC (134,1) PACKET: EXECUTE TELECOMMAND BATCH

AVS TC (134,1) telecommand is used for the upload of a batch of telecommands for immediate execution. The format of AVS TC (134,1) is shown in Figure 3.7-1. The maximum number of telecommands which can be grouped with a TC (134,1) is only limited to the maximum size of TC (134,1), that is 256 words.

TC (134,1) embedded telecommands (TC Packet-1, TC Packet-2 ...) will be checked and dispatched to the addressed PID. If embedded telecommands are to the same PID, then the execution order of telecommands with the same PID is as they appear in the TC (134,1). However if embedded telecommands address different PID, then the execution order is no longer guaranteed as it depends on the addressed PID scheduling and the telecommand required execution time. That is, it is possible that telecommands with different PID could be executed in parallel.

Note: TC (134,1) implements the same function as a TC aggregation (i.e. more than one TC packet in a TC Segment) with the added advantage that TC (134,1) has a maximum size of 512 bytes whereas TC aggregation would have been limited to 226 bytes. Also TC (134,1) is supported by Service 1 TC verification before the grouped TC are dispatched for execution. Sentinel-1 does not support TC aggregation.

Figure 3.7-1: AVS TC (134,1) Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Packet Header	Refer to section 3.4	
Data Field Header	Refer to section 3.4	
N° of TC Packets	Specifies the number of immediate TC embedded in the TC (134,1).	1 to P The only constraint is the maximum size limit of the TC packet (i.e. 256 words)

3.8 TC PACKET NESTING

In section 3.5 the general format of AVS TC (11,4) is defined showing the nesting of multiple time-tagged commands for the MTL within TC (11,4).

Similarly in section 3.6 the general format of AVS TC (132,4) is defined showing the nesting of multiple position-tagged commands for the MTL within TC (132,4).

While in section 3.7 the general format of AVS TC (134,1) is defined showing the nesting of multiple immediate commands to be dispatched and executed immediately.

The embedded "TC Packet" structure is generic and is the same for all services that use embedded TCs.

THALES

All rights reserved, 2007, Thales Alenia Space

100181547K-EN

There are no on-board checks of the embedded TC Source Sequence Count.

If a PEC is present it will be checked. Whether or not there is a PEC is driven by the PEC flag in the embedded TC header.

TC(11,4) and TC(132,4) embedded TC which address remote PID to the ASW and require to be dispatched on the 1553B Bus (i.e. SES, TCU, DSHA, LCT PID) must have a PEC. While the presence of a PEC on other embedded TC is optional. Internally generated or stored TC do not require a PEC.

4 TELEMETRY STRUCTURE

4.1 TELEMETRY TRANSFER FRAME

The Telemetry Transfer Frame conforms to the structure defined in [AS.04]. The TM Transfer Frame structure is shown in Figure 4.1-1 below

Attached Sync. Marker	Transfer Frame			Reed-Solomon Code Block
	Transfer Frame Header	Transfer Frame Data Field	Transfer Frame Trailer	
			CLCW	
	6 bytes	1105 bytes	4 bytes	
4 bytes	1115 bytes			160 bytes

Figure 4.1-1 TM Transfer Frame Structure

The Transfer Frame Primary Header conforms to the structure defined in [AS.04]. The structure is shown in Figure 4.1-2 below.

Version Number	Frame Identification			Master Channel Frame Counter	Virtual Channel Frame Counter	Frame Data Field Status				
	Spacecraft ID	Virtual Channel ID	Operational Control Field Flag			Secondary Header Flag	Data Field Synch. Flag	Packet Order Flag	Segment Length ID	First Header Pointer
2	10	3	1	8	8	1	1	1	2	11
2 bytes				1 byte	1 byte	2 bytes				

Figure 4.1-2 Transfer Frame Primary Header Structure

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be set to 0 for all TM Transfer Frames
Spacecraft ID		EQM: 3FF Hex Sentinel-1A PFM: 22B Hex Sentinel-1B FM2: 22D Hex
Virtual Channel ID	ID of the virtual channel	VC-0: TM containing all real time S/C TM packets. VC-1: TM containing HW generated High Priority

PARAMETER	DESCRIPTION	RANGE OR VALUE
		<p>TM packets.</p> <p>VC-6: TM containing playback TM packets which were stored in Packet Store A (periodic TM)</p> <p>VC-5: TM containing playback TM packets which were stored in Packet Store B (periodic TM).</p> <p>VC-3: TM containing playback TM packets which were stored in Packet Store C ("solicited" TM includes responses to a TC).</p> <p>VC-2: TM containing playback TM packets which were stored in Packet Store D (System Log).</p> <p>VC-7: Idle Transfer Frames</p>
Operational Control Field Flag	Indicates the presence or absence of the CLCW	Set to 1, CLCW present in each frame
Master Channel Frame Counter	Counter for Transfer Frames. Increments for each transfer frame in the downlink.	0 to 255. Modulo 256 counter.
Virtual Channel Frame Counter	One counter for each Virtual Channel. Increments for each transfer frame from a given virtual channel.	0 to 255. Modulo 256 counter.
Secondary Header Flag	Indicates presence or absence of a secondary header	Must be set to 0, no secondary header
Data Field Synch. Flag	Indicates the mode of packet insertion	Set to 0 to indicate that TM packets are inserted contiguously (synchronous insertion) on byte boundaries. The location of the byte containing the first header being indicated by the FHP in the frame header.
Packet Order Flag	Indicates forward or reverse order	Set to 0 to indicate forward order packets.
Segment Length ID	Identifies the selected maximum data field length of the TM packets being inserted in the frames of a given Virtual Channel.	Set to 11 to indicate no segmentation.
First Header Pointer	Pointer to the first byte of the first TM Source Packet	Number of bytes to the first byte of the first TM Packet

PARAMETER	DESCRIPTION	RANGE OR VALUE
		Set to 7FF _{hex} , if no TM Packet header in Frame Set to 7FE _{hex} for Idle Frames

4.2 IDLE TM TRANSFER FRAME

The Idle Transfer Frames are generated as per ESA Packet Telemetry Standard (PSS-04-106) page 29.

The First Header Pointer is set to all ones minus one (i.e. 1111111110) for an Idle TM Transfer Frame and the data field is filled with a string of "01" bits (i.e. 5555555.....).

4.3 TELEMETRY PACKET

The standard Sentinel-1 PUS Telemetry Packet format is shown in Figure 4.3-1. The TM Packet Time Stamp field format is shown in Figure 4.3-2 which is the same as the Time Tag field format of TC (11,4) given in Figure 3.5-2.

Figure 4.3-2: Time Stamp Field Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Must be set to 0 for all TM source packets
Type	Packet type (0 = telemetry, 1 = telecommand)	Must be set to 0 for all TM source packets
Data Field Header (DFH) Flag	Indicates the presence of a secondary (data field) header (when set to 1)	Must be set to 1 for all TM source packets, Exceptions: must be set to 0 for Time Packets, HPTM and Idle Packets
Process ID (PID)	Identifies the application process which generated the TM packet.	Refer to Table 8.1.1-1 (section 8.1.1)
Packet Category (PCAT)	Identifies the TM packet category which Ground uses in conjunction to PID and Source Sequence Count to immediately detect missing TM packet(s).	Refer to Table 8.1.2-2 (section 8.1.2)
Grouping Flag (GF)	Indicates the grouping (segmentation) of TM source packets	11 - stand alone TM packet
Source Sequence Count	Uniquely identify a TM packet generated by an APID. The APID increments by 1 this field for each new TM packet. The counter wrap-around occurs from $2^{14}-1$ to 0.	Must be set to 0 for first packet, increments up to $2^{14}-1$, wrap around to 0
Packet Length	Number of bytes contained in the [(Data Field Header + Data + PEC if present) – 1].	Min value is 9 if no PEC or 11 if with PEC. The max value is 249 Max size TM packet applicable to all packet terminals is 256 bytes. Note: The data for all fixed length PUS services e.g. TM(3,25), must always fit within the 256 byte constraint, i.e. a SID must never be delivered over several packets.
PEC Flag	Indicates the presence of the PEC field.	0 = No PEC field. 1 = PEC field NOTE: ASW does not support PEC. All remote packet terminals are required to support PEC.
OBT Status (OBTS)	Indicates S/C OBT synchronization status with respect to GPS.	00 = In-synch with GPS (nominal condition) 01 = GPS not available (indicates a drift condition) 10 = Synchronisation disabled (indicates a drift

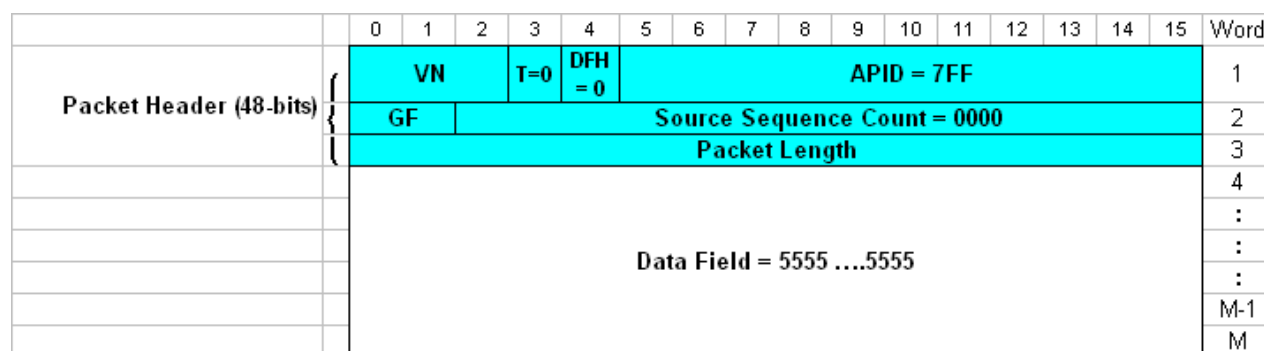

PARAMETER	DESCRIPTION	RANGE OR VALUE
	Only used by AVS. <u>Note</u> : Not applicable to GPS, C-SAR Instrument and PDHT S/S where '00' is reported.	condition) 11 = Synchronisation in progress (indicates that the sync status has not been reached)
Not Synchronised (NS)	Not Synchronised to S/C OBT. Used by C-SAR and PDHT S/S. Indicates that their OBT have not yet been synchronised to S/C OBT. Not applicable to AVS.	0 = Synchronised to S/C OBT. 1 = Not Synchronised
Error Flag (EF)	Indicates that at least one parameter in the data field is not valid. Only used by AVS.	0 = Nominal (all parameters are valid). 1 = Error, at least one parameter in the data field is not valid. <u>Note</u> : The EF is set for Ground use only. No onboard use is made by the ASW. It indicates that at least one of the parameter in the Data field is not valid or up-to-date. This could arise when data acquisitions from the 1553B Bus are interrupted due to an on-going recovery or a 1553B Bus acquisition error has occurred. The ASW checks the validity of the data pool when generating the TM packets.
Service Type	Indicates the service to which the packet relates	Any valid S1 PUS service
Service Subtype	Indicates the service subtype to which the packet relates	Any valid S1 PUS sub-service
Destination ID	Enables Ground to discriminate the onboard source of the "solicited" TM packet. Refer to section 8.2 for details.	Refer to Table 8.2-1 (section 8.2)
Time Stamp	Onboard time (OBT) in CUC format with MSB = 68 years and LSB = 3.9 ms.	Refer to Figure 4.2-2.
Data Field	Contains the data of the TM source packet.	The maximum length of the Data field is equal to 256 bytes minus 16 bytes of the standard headers which is equal to 240 bytes with no PEC present or 238 bytes with PEC. The maximum size TM packet has been fixed for Sentinel-1 to enable an efficient storage and retrieval of TM packet in Packet Stores.
Packet Error Control (PEC)	The PEC field transports an error detection code that	0 to $2^{16} - 1$

PARAMETER	DESCRIPTION	RANGE OR VALUE
	can be used by Ground to verify the integrity of the complete telemetry source packet. The PEC is CRC as specified in [AS.01] Annex A1.	

4.4 IDLE TM PACKET

The "Idle" TM Packet are generated by the ASW when a filler telemetry packet is required.

The "Idle" TM Packet format is as shown in figure 4.4-1 where :

The minimum size "Idle" TM Packet is 8 bytes.

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Set to 0
Type	Packet type (0 = telemetry, 1 = telecommand)	Set to 0
Data Field Header (DFH) Flag	Indicates the presence of a data field header	Set to 0
Application Identifier (APID)	The APID of the Idle packet is set to "all ones".	Set to 7FF (Hex)
Grouping Flag (GF)	Indicates the grouping (segmentation) of TM source packets	Set to 11 to indicate standalone
Source Sequence Count	The Source Sequence Count is set to a fixed value.	Set to 0000 Hex.
Packet Length	Number of bytes contained in the packet data field minus 1	1..N

4.5 TIME TM PACKET

The Time Packet format is as shown in Figure 4.5-1. The Time Packet has no Data Field Header and hence not a standard PUS TM packet (i.e. The Time Packet covers TM (9,2) Time Report but without a standard PUS Data Field Header). The Time Packet is generated every 16 VC-0 TM Transfer Frames which results with a Time Packet every approx. 24 sec. The Time Packet generation rate is a PROM configuration parameter which cannot be changed in flight.

		TIME PACKET FORMAT

Figure 4.5-2 Frozen SMU OBT Format

PARAMETER	DESCRIPTION	RANGE OR VALUE
Version Number	CCSDS Version Number	Set to 0
Type	Packet type (0 = telemetry, 1 = telecommand)	Set to 0
Data Field Header (DFH) Flag	Indicates the presence of a secondary (data field) header (when set to 1)	Set to 0 for Time Packet
Process ID (PID)	Identifies the application	Set to 0 for Time Packet

PARAMETER	DESCRIPTION	RANGE OR VALUE
	process.	
Packet Category (PCAT)	Identifies the TM packet category.	Set to 0 for Time Packet
Grouping Flag (GF)	Indicates the grouping (segmentation) of TM source packets	Set to '11'.
Source Sequence Count	Uniquely identify a TM packet generated by an APID. The APID increments by 1 this field for each new TM packet.	Set to 0 for first packet, increments up to $2^{14}-1$, wrap around to 0.
Packet Length	Number of bytes contained in the packet data field minus 1	Set to 9.
Frozen SMU OBT	SMU OBT time HW sampled and buffered at TM sync signal instant.	Refer to Figure 4.5-2.
OBT Status (OBTS)	Indicates S/C OBT synchronization status with respect to GPS.	00 = In-synch with GPS (nominal condition) 01 = GPS not available (indicates a drift condition) 10 = Synchronisation disabled (indicates a drift condition) 11 = Synchronisation in progress (indicates that the sync status has not been reached)

4.6 HIGH PRIORITY TM PACKET

The High Priority TM (HPTM) packet is periodically generated by the SMU TMTCCM board in use (referred as the TM Active). The format of the HPTM packet is shown in Figure 4.6-1. One HPTM packet at a time is generated by the TMTCCM board and the HPTM packet contains the data from both the main and redundant sections of the SMU. The TMTCCM board in use is identified by the APID.

The HPTM generation rate is programmable. The baseline is to generate one HPTM packet every 8 TM Transfer Frames (TF). Hence VC1 TM TF would be downlinked every approximately 59 TM TF.

5.5 SERVICE 5: EVENT REPORTING

The following summary table provides Service 5 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(5,1)	Normal / Progress Report	TM	Y	Y	Y	Y	Y	N	Y	N	Y
(5,2)	Error / Anomaly Report – Low Severity	TM	Y	Y	Y	Y	Y	N	Y	N	Y
(5,3)	Error / Anomaly Report – Medium Severity	TM	Y	Y	Y	Y	Y	N	Y	N	Y
(5,4)	Error / Anomaly Report – High Severity	TM	Y	Y	Y	Y	Y	N	Y	N	Y
(5,5)	Enable Event Packet Generation	TC	N	N	N	Y	N	N	Y	N	Y
(5,6)	Disable Event Packet Generation	TC	N	N	N	Y	N	N	Y	N	Y
(5,129)	Report List of Disabled Events	TC	N	N	N	Y	N	N	Y	N	Y
(5,130)	List of Disabled Events Report	TM	N	N	N	Y	N	N	Y	N	Y
(5,160)	SES Save Event Configuration Data	TC	N	N	N	Y	N	N	N	N	N
(5, 210)	GPS Enable Event Packet Generation	TC	N	N	Y	N	N	N	N	N	N
(5, 211)	GPS Disable Event Packet Generation	TC	N	N	Y	N	N	N	N	N	N
(5, 212)	GPS Report Disabled Event Packets	TC	N	N	Y	N	N	N	N	N	N
(5, 213)	GPS Disabled Event Packets Report	TM	N	N	Y	N	N	N	N	N	N

NOTE :

1. ASW Event status is report with TM(19,153) and requested through TC(19,152). Hence TC(5,129) and TM(5,130) are not applicable to ASW.
2. TC(5,5) and TC(5,6) not applicable to ASW as controlled through private subtype TC(19,146).

5.6 SERVICE 6: MEMORY MANAGEMENT

The following summary table provides Service 6 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(6,1)	Load Memory using Base plus Offsets	TC	Y	Y	N	N	N	N	N	N	N
(6,2)	Load Memory using Absolute Addresses	TC	Y	Y	N	Y	Y	Y	Y	Y	Y
(6,3)	Dump Memory using Base plus Offsets	TC	Y	Y	N	N	N	N	N	N	N
(6,4)	Memory Dump using Base plus Offsets Report – (*)	TM	N	N	N	N	N	N	N	N	N

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(6,5)	Dump Memory using Absolute Addresses	TC	Y	Y	N	Y	Y	Y	Y	Y	Y
(6,6)	Memory Dump using Absolute Addresses Report	TM	Y	Y	N	Y	Y	Y	Y	Y	Y
(6,7)	Check Memory using Base plus Offset	TC	N	N	N	N	N	N	N	N	N
(6,8)	Memory Check using Base plus Offset Report	TM	N	N	N	N	N	N	N	N	N
(6,9)	Check Memory using Absolute Addresses	TC	Y	Y	N	Y	Y	Y	Y	Y	Y
(6,10)	Memory Check using Absolute Addresses Report	TM	Y	Y	N	Y	Y	Y	Y	Y	Y
(6,144)	Physical Address Resolution Report	TM	Y	Y	N	N	N	N	N	N	N
(6,145)	Memory Dump using Base plus Offset Report – (*)	TM	Y	Y	N	N	N	N	N	N	N
(6,146)	Load Logical Parameters	TC	Y	Y	N	N	N	N	N	N	N
(6,147)	Dump Logical Parameter	TC	Y	Y	N	N	N	N	N	N	N
(6,148)	Logical Parameter Dump	TM	Y	Y	N	N	N	N	N	N	N
(6,149)	Register Load	TC	Y	Y	N	N	N	N	N	N	N
(6,150)	Dump Register	TC	Y	Y	N	N	N	N	N	N	N
(6,151)	Register Dump	TM	Y	Y	N	N	N	N	N	N	N
(6,161)	Copy RAM to EEPROM	TC	N	N	N	Y	Y	N	N	N	N
(6,162)	Copy EEPROM to RAM	TC	N	N	N	N	Y	Y	N	N	N
(6, 210)	GPS Copy Memory	TC	N	N	Y	N	N	N	N	N	N
(6, 212)	GPS Load Memory using Absolute Addresses	TC	N	N	Y	N	N	N	N	N	N
(6, 215)	GPS Dump Memory using Absolute Addresses	TC	N	N	Y	N	N	N	N	N	N
(6, 216)	GPS Memory Dump using Absolute Addresses Report	TM	N	N	Y	N	N	N	N	N	N
(6, 219)	GPS Check Memory using Absolute Addresses	TC	N	N	Y	N	N	N	N	N	N
(6, 218)	GPS Memory Check using Absolute Addresses Report	TM	N	N	Y	N	N	N	N	N	N
(6,224)	DSHA Copy EEPROM to RAM	TC	N	N	N	N	N	N	N	Y	N
(6,225)	DSHA Copy RAM to EEPROM	TC	N	N	N	N	N	N	Y	Y	N
(6,240)	Copy Memory	TC	N	N	N	N	N	N	N	N	Y
(6,241)	Inflate OAS Image	TC	N	N	N	N	N	N	N	N	Y
(6,242)	Switch Application Memory	TC	N	N	N	N	N	N	N	N	Y
(6,243)	Dump Error Log Memory	TC	N	N	N	N	N	N	N	N	Y

(*) - TM (6,145) is the response to TC (6,3). Before the generation of TM (6,145), TM (6,144) is generated which reports the physical address correspondence of the Base ID. TM (6,145) includes the physical address and not the "Base ID" and "Offset" as PUS TM (6,4). TM (6,145) substitutes PUS TM (6,4).

The Dump TM packets are generated periodically up to completion of the dump. Constraints are imposed on maximum dump rates linked to the allocated TM bandwidth.

5.7 SERVICE 8: FUNCTIONS MANAGEMENT

The following summary table provides Service 8 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(8,1)	LCT Perform Function	TC	N	N	N	N	N	N	N	N	Y
(8,217)	TCU Change Mode To Operation	TC	N	N	N	N	Y	N	N	N	N
(8,218)	TCU Change Mode To Init	TC	N	N	N	N	Y	N	N	N	N
(8,219)	TCU Issue TA-A On Pulse Command to TPSU	TC	N	N	N	N	Y	N	N	N	N
(8,220)	TCU Issue TA-B On Pulse Command to TPSU	TC	N	N	N	N	Y	N	N	N	N
(8,221)	TCU Update Power Sync Phase Control Register	TC	N	N	N	N	Y	N	N	N	N
(8,222)	TCU Update RABCF Parameters	TC	N	N	N	N	Y	N	N	N	N
(8,240)	LCT Enable Function Execution	TC	N	N	N	N	N	N	N	N	Y
(8,241)	LCT Disable Function Execution	TC	N	N	N	N	N	N	N	N	Y
(8,242)	LCT Enable Function Arming	TC	N	N	N	N	N	N	N	N	Y
(8,243)	LCT Disable Function Arming	TC	N	N	N	N	N	N	N	N	Y
(8,244)	LCT Report Function Status	TC	N	N	N	N	N	N	N	N	Y
(8,245)	LCT Function Status Report	TM	N	N	N	N	N	N	N	N	Y

NOTE: Service 8 subtypes are mainly S/S specific and only a limited commonality of subtypes exist between S/S.

Both OIRD FM-1 and FM-2 requirements are applicable to AVS, C-SAR and PDHT through the respective applicable Command & Control Specification documents.

The referenced OIRD requirements state:

FM-1: It shall be possible for the ground to exercise control over an on-board software Application Function in the following manner:

- activate a Function;
- de-activate a Function;
- suspend/resume a Function (when meaningful for the function);
- communicate parameters to a Function.

OIRD FM-3: It shall be possible for the ground to inspect the loaded Function parameters at any time prior to Function activation as well as whilst they are use.

5.8 SERVICE 9: ON-BOARD TIME MANAGEMENT

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(9,1)	Change Time Report Generation Rate	TC	N	N	N	N	N	N	N	N	N
(9,2)	Time Report (*)	TM	Y	Y	N	N	N	N	N	N	N
(9,144)	Set Delta OBT	TC	Y	Y	N	N	N	N	N	N	N
(9,145)	Modify Delta OBT	TC	Y	Y	N	N	N	N	N	N	N
(9,146)	Align Standby OBT	TC	Y	Y	N	N	N	N	N	N	N
(9,147)	Synchronise Instrument	TC	Y	N	N	N	N	N	N	N	N
(9,148)	Synchronise PDHT	TC	Y	N	N	N	N	N	N	N	N
(9,149)	Synchronise LCT	TC	Y	N	N	N	N	N	N	N	N
(9,129)	Instrument / PDHT / LCT Set Time	TC	N	N	N	Y	N	N	Y	N	Y
(9,130)	Instrument / PDHT / LCT Report Time	TC	N	N	N	Y	N	N	Y	N	Y
(9,160)	Instrument Time Report	TM	N	N	N	Y	N	N	N	N	N
(9, 224)	PDHT Time Report	TM	N	N	N	N	N	N	Y	N	N
(9, 241)	LCT Time Report	TM	N	N	N	N	N	N	N	N	Y

(*) – AVS Time Report has no Data Field Header, as per PUS. Time TM Packet format is specified in section 4.5.

5.9 SERVICE 11: TIME-TAG MISSION SCHEDULE SERVICE

A centralised On-Board Mission Schedule is supported by the AVS. The On-Board Mission Schedule is implemented by the AVS with two distinct command schedules, the Time-Tagged TC Schedule (Service 11) and the Position-Tagged TC Schedule (Service 132). A complete set of PUS On-Board Command Schedule services are supported by AVS for each of the command schedules, as reflected in the summary table below, for Ground management of the on-board Mission Time Line (MTL) commands.

Hence Ground updates of the S/C MTL only involves the AVS command schedules as per OIRD OBMT-4 requirement.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(11,1)	Enable Release of Time-Tagged TC	TC	Y	Y	N	N	N	N	N	N	N
(11,2)	Disable Release of Time-Tagged TC	TC	Y	Y	N	N	N	N	N	N	N
(11,3)	Reset Time-Tagged Schedule	TC	Y	Y	N	N	N	N	N	N	N
(11,4)	Insert TC in Time-Tagged Schedule	TC	Y	Y	N	N	N	N	N	N	N
(11,5)	Delete TC from Time-Tagged Schedule	TC	Y	Y	N	N	N	N	N	N	N
(11,6)	Delete TT-TC over Time Period and Sub-Schedule	TC	Y	N	N	N	N	N	N	N	N
(11,144)	Delete TT-TC over Time Period and APID	TC	Y	N	N	N	N	N	N	N	N
(11,7)	Time-Shift Selected Time-Tagged Telecommands	TC	Y	N	N	N	N	N	N	N	N
(11,8)	Time-Shift TT-TC over Time Period and Sub-Schedule	TC	Y	N	N	N	N	N	N	N	N
(11,145)	Time-Shift TT-TC over Time Period and Sub-APID	TC	Y	N	N	N	N	N	N	N	N
(11,10)	Detailed Time-Tagged Command Schedule Report	TM	Y	Y	N	N	N	N	N	N	N
(11,13)	Summary Time-Tagged Command Schedule Report	TM	Y	Y	N	N	N	N	N	N	N
(11,15)	Time-Shift all Time-Tagged Telecommands	TC	Y	N	N	N	N	N	N	N	N
(11,16)	Report Time-Tagged Command Schedule in Detailed Form	TC	Y	Y	N	N	N	N	N	N	N
(11,17)	Report Time-Tagged Command Schedule in Summary Form	TC	Y	Y	N	N	N	N	N	N	N
(11,18)	Report Status of Time-Tagged Command Schedule	TC	Y	Y	N	N	N	N	N	N	N
(11,19)	Time-Tagged Command Schedule Status Report	TM	Y	Y	N	N	N	N	N	N	N

5.10 SERVICE 12: ON-BOARD MONITORING

The following summary table provides Service 12 applicability.

Parameter monitoring allows a single parameter contained in a data pool to be monitored against a limit set or an expected status value and react with a specified event report if the parameter gets out-of-limit.. When an error is repeated for a configurable number of consecutive times the monitor reports, via a specified event packet.

Parameter monitoring information is maintained which drives the parameter monitoring activity and the generation of Out-of-Limit Reports.

The ground segment can modify or report the contents of the parameter monitoring list or Monitoring Data Set (MDS) tables for the case of AVS using service requests to:

- Enable or disable the monitoring checks of parameters in the Monitoring List or MDS;
- Add, delete or modify the Monitoring List or MDS;
- Report the monitoring check information for all parameters in the Monitoring List or MDS;
- Report the set of checks which are currently out-of-limits.

The On-Board Monitoring Service maintains static monitoring check information for each parameter to be monitored. A check definition provides the information required to check a sample of the parameter against either one pair of limits, one expected value. More than one check definition may be associated with a given parameter. A check definition indicates:

- The nature of the check to be performed which can be a Limit-check. or an Expected-value check. For a Limit-check, a low-limit value and a high-limit value are specified. For an Expected-value-check, an expected value is specified.
- A "repetition count". For a limit-check or an expected-value-check, this indicates the number of successive samples of the parameter which must fail (or succeed) the check in order to establish a new checking status for the parameter.

TM (5,2) report is generated to report OOL condition classified as low severity. TM (5,3) report is generated to report OOL condition classified as medium severity. While TM (5,4) report is generated to report OOL condition classified as high severity.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(12,1)	Enable Monitoring of Parameters	TC	N	N	N	Y	Y	N	Y	N	N

(12,155)	MDS Report	TM	Y	Y	N	N	N	N	N	N	N
(12,160)	Save Monitoring Configuration Data	TC	N	N	N	Y	Y	N	N	N	N
(12,161)	Add Parameters to Monitoring List	TC	N	N	N	Y	N	N	N	N	N
(12,162)	Current Monitoring List Report	TM	N	N	N	Y	N	N	N	N	N
(12,163)	Modify Parameter Checking Information	TC	N	N	N	Y	N	N	N	N	N
(12,227)	Modify Parameter Checking Information	TC	N	N	N	N	N	N	Y	N	N
(12,229)	Current Monitoring List Report	TM	N	N	N	N	N	N	Y	N	N

NOTE:

- The enable/disable of the On-Board Monitoring Function is performed using TC (12,1) and TC (12,2) with N=0 as per PUS.

5.11 SERVICE 13: LARGE DATA TRANSFER

Not supported.

5.12 SERVICE 14: PACKET TRANSMISSION CONTROL

The following summary table provides Service 14 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(14,1)	Enable Forwarding of Telemetry Source Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,2)	Disable Forwarding of Telemetry Source Packets	TC	Y	Y	N	N	N	N	N	N	N

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(14,3)	Report Disabled Telemetry Source Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,4)	Disabled Telemetry Source Packets Report	TM	Y	Y	N	N	N	N	N	N	N
(14,144)	Enable Forwarding of Housekeeping Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,145)	Disable Forwarding of Housekeeping Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,7)	Report Disabled Housekeeping Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,146)	Disabled Housekeeping Packets Report	TM	Y	Y	N	N	N	N	N	N	N
(14,147)	Enable Forwarding of Diagnostic Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,148)	Disable Forwarding of Diagnostic Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,11)	Report Disabled Diagnostic Packets	TC	Y	Y	N	N	N	N	N	N	N
(14,149)	Disabled Diagnostic Packets Report	TM	Y	Y	N	N	N	N	N	N	N
(14,13)	Enable Forwarding of Event Report Packets	TC	N	N	N	N	N	N	N	N	N
(14,14)	Disable Forwarding of Event Report Packets	TC	N	N	N	N	N	N	N	N	N
(14,15)	Report Disabled Event Report Packets	TC	N	N	N	N	N	N	N	N	N
(14,16)	Disabled Event Report Packets Report	TM	N	N	N	N	N	N	N	N	N

NOTE:

1. TC (14,1) and TC (14,2) allows to filter the packets per type / subtype.
2. In Ultimate Safe Mode (USM) (i.e. SM ASW running) the number of telemetry source packets are considerably reduced with respect to all the other S/C modes supported by NM ASW. The Housekeeping packets are predefined, enabled and down-linked.
3. The telemetry throughput is 885 kbps at TM packet level with 1024 Kbps downlink rate at CADU level. This volume of data is due to the playback telemetry stored in the packet stores and not due to the real time telemetry. The real time telemetry peak rate could reach about 50 Kbps when performing a dump considering also the HPTM

5.13 SERVICE 15: ON-BOARD STORAGE AND RETRIEVAL

The following summary table provides Service 15 applicability.

AVS SMU supports four Packet Stores and a possible telemetry mapping is as follows:

- Packet Store A would be allocated for periodic TM (e.g. platform)
- Packet Store B would also be allocated for periodic TM (e.g. payload)
- Packet Store C would be allocated to "Solicited" TM, that is all TM packets generated in response to a TC. This includes the Service 1 reports and other TM packets like list & status reports, etc.
- System Log Packet Store storing the significant events

The mapping between TM PID, Service Type and Service Subtype to specific Packet Store is managed by the ASW and is configurable in flight through Service 15.

Service types (15,9), (15,11), (15,128), (15,146) and (15,147) are not applicable to the System Log. While (15,148) is only applicable to the System Log.

The PDHT DSHA stores and retrieves SAR H Polarisation Data, SAR V Polarisation Data, S/C TM and Auxiliary Data in Packet Stores.

The content of the 4 DSHA Packet Stores allocated for S/C TM would contain the same TM packets as the equivalent SMU Packet Stores A, B, C and System Log. It is possible through the ASW service TC(15,1) and TC(15,2) to enable and disable a specific Packet Store filling (SMU and/or DSHA). Hence for each corresponding pair of Packet Stores in the SMU and DSHA, it is possible to store in both Packet Stores (SMU and DSHA) or in only one Packet Store, either the SMU Packet Store or the DSHA Packet Store.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(15,1)	Enable Storage in Packet Stores	TC	Y	Y	N	N	N	N	Y	N	N

(15,232)	Abort	TC	N	N	N	N	N	N	Y	N	N
(15,233)	Set Nominal Read Pointer of Packet Store	TC	N	N	N	N	N	N	Y	N	N

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(15,234)	Delete Packet Store Contents up to Read Pointer	TC	N	N	N	N	N	N	Y	N	N

NOTE:

1. TC (15,3) allows to add packets by type / subtype.
2. TC (15,8) is not applicable as the TM packets both for the SMU Packet Stores and DSHA Packet Stores are directly down-linked from memory to the downlink channel.

5.14 SERVICE 17: CONNECTION TEST

The following summary table provides Service 17 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(17,1)	Perform Connection Test	TC	Y	Y	Y	Y	Y	Y	Y	Y	Y
(17,2)	Connection Test Report	TM	Y	Y	Y	Y	Y	Y	Y	Y	Y

5.15 SERVICE 18: ON-BOARD OPERATIONS PROCEDURES SERVICE

The following summary table provides Service 18 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(18,1)	Load Procedure	TC	N	N	N	N	N	N	N	N	N
(18,144)	Add / Modify OBOP	TC	Y	Y	N	N	N	N	N	N	N
(18,160)	Add Telecommand to OBOP	TC	N	N	N	Y	N	N	N	N	N
(18,2)	Delete Procedure	TC	Y	Y	N	Y	N	N	N	N	N
(18,3)	Start Procedure	TC	Y	Y	N	Y	N	N	N	N	N
(18,4)	Stop Procedure	TC	Y	Y	N	Y	N	N	N	N	N

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(18,5)	Suspend Procedure	TC	N	N	N	N	N	N	N	N	N
(18,6)	Resume Procedure	TC	N	N	N	N	N	N	N	N	N
(18,7)	Communicate Parameters to a Procedure	TC	N	N	N	N	N	N	N	N	N
(18,8)	Report List of Onboard Operation Procedure	TC	N	N	N	N	N	N	N	N	N
(18,162)	Report List of Onboard Operation Procedure	TC	N	N	N	Y	N	N	N	N	N
(18,145)	Report List of OBOP with Status	TC	Y	Y	N	N	N	N	N	N	N
(18,9)	Onboard Operation Procedures List Report	TM	N	N	N	N	N	N	N	N	N
(18,146)	OBOP List with Status Report	TM	Y	Y	N	N	N	N	N	N	N
(18,163)	List Of Onboard Operations Procedures Report	TM	N	N	N	Y	N	N	N	N	N
(18,130)	Report OBOP Detailed Definition	TC	Y	Y	N	Y	N	N	N	N	N
(18,149)	OBOP Flow Control	TC	Y	Y	N	N	N	N	N	N	N
(18,150)	AVS OBOP Definition Report	TM	Y	Y	N	N	N	N	N	N	N
(18,151)	OBOP Termination	TC	Y	Y	N	N	N	N	N	N	N
(18,147)	Enable OBOP	TC	Y	Y	N	N	N	N	N	N	N
(18,148)	Disable OBOP	TC	Y	Y	N	N	N	N	N	N	N
(18,164)	SES OBOP Detailed Definition Report	TM	N	N	N	Y	N	N	N	N	N
(18,10)	Report List of Active Onboard Operation Procedures	TC	Y	Y	N	N	N	N	N	N	N
(18,11)	Onboard Active Operations Procedures List Report	TM	Y	Y	N	N	N	N	N	N	N
(18,12)	Abort Procedure	TC	N	N	N	N	N	N	N	N	N
(18,161)	Save OBOP Configuration Data	TC	N	N	N	Y	N	N	N	N	N

Note:

1. For ASW, TC(18,144) is used to load new OBOP, i.e. list of TCs with associated time information, to a spare on-board location. Same service is used to modify all or part of an existing OBOP.
2. C-SAR has a fixed number of OBOP, some of which are empty. Then service TC(18,160) can be used to add TCs to these OBOP. TC(18,2) can be used to delete an OBOP

5.16 SERVICE 19: EVENT DETECTION AND ACTION EXECUTION

The following summary table provides Service 19 applicability.

ID	Name	Type	AVS			C-SAR			PDHT		LCT
			NM ASW	SM ASW	GPS	ICM	TCU	ICM BOOT	DSHA	DSHA BOOT	
(19,1)	Add Events to the Detection List	TC	N	N	N	N	N	N	N	N	N
(19,2)	Delete Events from the Detection List	TC	N	N	N	Y	N	N	N	N	N
(19,3)	Clear the Event Detection List	TC	N	N	N	N	N	N	N	N	N
(19,4)	Enable Actions	TC	N	N	N	Y	N	N	N	N	N
(19,5)	Disable Actions	TC	N	N	N	Y	N	N	N	N	N
(19,6)	Report the Event Detection List	TC	N	N	N	Y	N	N	N	N	N
(19,7)	Event Detection List Report	TM	N	N	N	Y	N	N	N	N	N
(19,128)	Report Event Action	TC	N	N	N	Y	N	N	N	N	N
(19,129)	Event Action Report	TM	N	N	N	Y	N	N	N	N	N
(19,144)	Configure RID-Event Table Event Fields	TC	Y	Y	N	N	N	N	N	N	N
(19,145)	Configure RID-Event Table Enable/Disable Fields	TC	Y	Y	N	N	N	N	N	N	N
(19,146)	Configure Event-Action Table Parameter Fields	TC	Y	Y	N	N	N	N	N	N	N
(19,147)	Configure Event-Action Table Enable/Disable Fields	TC	Y	Y	N	N	N	N	N	N	N
(19,148)	Report RID-Event Table Configuration	TC	Y	Y	N	N	N	N	N	N	N

(19,154)	Report Event-Action Table Status	TC	Y	Y	N	N	N	N	N	N	N
(19,155)	Event-Action Table Status Report	TM	Y	Y	N	N	N	N	N	N	N
(19,156)	Enable Event-Action Service	TC	Y	Y	N	N	N	N	N	N	N
(19,157)	Disable Event-Action Service	TC	Y	Y	N	N	N	N	N	N	N
(19,160)	Add Events to the Detection List	TC	N	N	N	Y	N	N	N	N	N
(19,161)	Save Event Detection List Configuration Data	TC	N	N	N	Y	N	N	N	N	N

5.17 ASW MISSION SPECIFIC SERVICES

5.17.1 Service 130: Command Database Management Service

The Command Database Management Service allows the management of the On-board Command Data Base.

ID	Name	Type	AVS	
			NM ASW	SM ASW
(130,1)	Insert Telecommand	TC	Y	Y
(130,2)	Reset Spare OBCD Section	TC	Y	Y
(130,3)	Report Free Available Space	TC	Y	Y
(130,4)	Free Available Space Report	TM	Y	Y
(130,5)	Dump OBCD Telecommand	TC	Y	Y
(130,6)	Dump OBCD Telecommand Report	TM	Y	Y
(130,7)	Execute Telecommand	TC	Y	Y
(130,8)	Enable OBCD Telecommand	TC	Y	Y
(130,9)	Disable OBCD Telecommand	TC	Y	Y
(130,10)	Modify OBCD Telecommand	TC	Y	Y

5.17.2 Service 131: Orbit Management Service

ID	Name	Type	AVS	
			NM ASW	SM ASW
(131,1)	Set Orbit Number	TC	Y	N
(131,2)	Report Orbit Number	TC	Y	N
(131,3)	Orbit Number Report	TM	Y	N

5.17.3 Service 132: Position-Tag Mission Schedule Services

The Position-Tag Mission Schedule Service allows the management of the position-tagged telecommands.

ID	Name	Type	AVS	
			NM ASW	SM ASW
(132,1)	Enable Release of Position-Tagged Telecommands	TC	Y	N
(132,2)	Disable Release of Position-Tagged Telecommands	TC	Y	N
(132,3)	Reset Position-Tagged Command Schedule	TC	Y	N
(132,4)	Insert Position-Tagged Telecommands in Command Schedule	TC	Y	N
(132,5)	Delete Position-Tagged Telecommands	TC	Y	N
(132,6)	Delete Position-Tagged TC over Position Interval and Sub-Schedule	TC	Y	N
(132,144)	Delete Position-Tagged TC over Position Interval and APID	TC	Y	N
(132,10)	Detailed Position-Tagged Command Schedule Report	TM	Y	N
(132,13)	Summary Position-Tagged Command Schedule Report	TM	Y	N
(132,16)	Report Position-Tagged Command Schedule in Detailed Form	TC	Y	N
(132,17)	Report Position-Tagged Command Schedule in Summary Form	TC	Y	N
(132,18)	Report Status of Position-Tagged Command Schedule	TC	Y	N
(132,19)	Position-Tagged Command Schedule Status Report	TM	Y	N

5.17.4 Service 133: Two-Step Telecommand Management Service

The Two-Step Telecommands Management Service allows to execute commands as two step commands for secure operations.

ID	Name	Type	AVS	
			NM ASW	SM ASW
(133,1)	Arm Telecommand	TC	Y	Y
(133,2)	Download Armed Telecommand	TC	Y	Y
(133,3)	Armed Telecommand Report	TM	Y	Y
(133,4)	Delete Armed Telecommand	TC	Y	Y
(133,5)	Fire Telecommand	TC	Y	Y

5.17.5 Service 134: Telecommand Batch Management Service

The Telecommands Batch Management Service allows to manage groups of TC packets sent by Ground in a single TC for immediate execution.

ID	Name	Type	AVS	
			NM ASW	SM ASW
(134,1)	Execute Telecommand Batch	TC	Y	Y

5.17.6 Service 135: Spacecraft Management Service

ID	Name	Type	AVS	
			NM ASW	SM ASW
(135,1)	Change Mode Transition Plausibility Table (TC_SC_CMTTP)	TC	Y	N
(135,2)	Report Mode Transition Plausibility Table (TC_SC_RMTP)	TC	Y	N
(135,3)	Mode Transition Plausibility Table Report (MTPR TM)	TM	Y	N
(135,4)	Change Configuration Action Sequence Table (TC_SC_CCAS)	TC	Y	N
(135,5)	Report Configuration Actions Sequence Table (TC_SC_RCAS)	TC	Y	N
(135,6)	Configuration Actions Sequence Table Report (CASR TM)	TM	Y	N
(135,128)	S/C Operational Mode Transition Nominal (TC_SC_MOTR)	TC	Y	N
(135,129)	S/C Operational Mode Transition Spare (TC_SC_MOSP)	TC	Y	N
(135,130)	S/C Operational Mode FDIR (TC_SC_MOFD)	TC	Y	N

5.17.7 Service 136: SM AOCS Management Service

ID	Name	Type	AVS	
			NM ASW	SM ASW
AOCS CGYRO Management				
(136,1)	Switch CGYRO Off	TC	N	Y
(136,2)	Switch CGYRO On	TC	N	Y
(136,3)	Enable CGYRO Acquisition	TC	N	Y
(136,4)	Disable CGYRO Acquisition	TC	N	Y
(136,5)	Transmit CGYRO Low Level Command	TC	N	Y
(136,6)	Receive CGYRO Low Level Data	TC	N	Y
(136,7)	Configure CGYRO On-Control	TC	N	Y
(136,8)	Set CGYRO Subsystem Mode	TC	N	Y

ID	Name	Type	AVS	
			NM ASW	SM ASW
(136,9)	Reset CGYRO	TC	N	Y
(136,10)	CGYRO Low-Level Data Report	TM	N	Y
AOCN SMM Assembly Management				
(136,26)	Set SMM Assembly Mode	TC	N	Y

(241,149)	LCT Goto Calibration Mode	TC	Y
(241,150)	LCT Goto Operation Mode	TC	Y
(241,152)	LCT Goto Safe Mode	TC	Y
(241,153)	Report TAPCO Software Status	TC	Y

ID	Name	Type	LCT
(241,154)	TAPCO Software Status Report	TM	Y
(241,155)	LCT Goto Launch Lock Release Mode	TC	Y
(241,156)	LCT Goto Emergency Safe	TC	Y
(241,157)	Get LCT Self Calibration Report	TC	Y
(241,158)	LCT Self Calibration Report	TM	Y
(241,159)	LCT Goto Application SW Boot Mode from Address	TC	Y

5.21.3 Service 242: LCT Configuration Service

ID	Name	Type	LCT
(242,2)	Get Terminal Configuration	TC	Y
(242,3)	Terminal Configuration Report	TM	Y
(242,4)	Perform Measurement (No Parameter Change)	TC	Y
(242,5)	Select 1PPS Synchronization Signal A	TC	Y
(242,6)	Select 1PPS Synchronization Signal B	TC	Y
(242,7)	Set Pump Module Head TX Laser Bench Configuration	TC	Y
(242,8)	Set Pump Module Head LO Laser Bench Configuration	TC	Y
(242,9)	Set Optical Power Amplifier 1 Laser Diode Configuration	TC	Y
(242,10)	Set Optical Power Amplifier 2 Laser Diode Configuration	TC	Y
(242,11)	Set Optical Power Amplifier 3 Laser Diode Configuration	TC	Y
(242,12)	Set Data Transmission Configuration	TC	Y
(242,13)	Set CPA Encoder Azimuth Configuration	TC	Y
(242,14)	Set CPA Encoder Elevation Configuration	TC	Y
(242,128)	Copy Terminal Configuratin from RAM to EEPROM	TC	Y
(242,129)	Copy Terminal Configuratin from EEPROM to RAM	TC	Y

5.21.4 Service 244: LCT Table Management Service

ID	Name	Type	LCT
(244,1)	Set Table Row	TC	Y
(244,2)	Get Table Row	TC	Y
(244,3)	Table Row Report	TM	Y
(244,4)	Reload Default Table from EEPROM	TC	Y
(244,5)	Update Default Table to EEPROM	TC	Y

5.21.5 Service 245: LCT Commanded Functional Test Mode Service

ID	Name	Type	LCT
(245,2)	Switch LCT Internal Unit Power On/Off	TC	Y
(245,3)	Switch RXDE/TXDE Functions On/Off	TC	Y
(245,4)	Set RXDE Channel Rotator (Manual)	TC	Y
(245,5)	Reset TXDE/RXDE Functions	TC	Y
(245,7)	Set Optical Power Amplifier (OPA) Parameter Set	TC	Y
(245,8)	Set Fine Pointing Assembly (FPA) Parameter Set	TC	Y
(245,9)	Set Point Ahead Assembly (PAA) Parameter Set	TC	Y
(245,10)	Set Coarse Pointing Assembly (CPA) Parameter Set	TC	Y
(245,11)	Activate/Deactivate Loops	TC	Y
(245,12)	Start Self Calibration	TC	Y
(245,13)	Start Operation	TC	Y
(245,14)	Continue Acquisition	TC	Y
(245,15)	Start Tracking with PAA	TC	Y
(245,16)	Perform Measurement (Sweep, Scan)	TC	Y
(245,17)	Enable/Disable PAT Mechanisms	TC	Y
(245,18)	Stop All Running PAT Algorithms	TC	Y
(245,19)	Reset LCT Measurement Results Memory	TC	Y
(245,21)	Switch LCT Internal Heater Power On/Off	TC	Y
(245,25)	Start RXA Diagnostic Data Measurement	TC	Y
(245,26)	Get RXA Diagnostic Data Report	TC	Y
(245,27)	RXA Diagnostic Data Report	TM	Y
(245,32)	Start Automatic Heater Powering	TC	Y
(245,33)	Stop Automatic Heater Powering	TC	Y
(245,34)	Set ASK EOM Parameter	TC	Y
(245,35)	Switch OPLL Integrator On/Off	TC	Y
(245,36)	Set PMH-TX Heater Control Temperature Parameter	TC	Y
(245,37)	Set PMH-LO Heater Control Temperature Parameter	TC	Y
(245,38)	Set CC-A Heater Control Temperature Parameter	TC	Y
(245,39)	Set CC-B Heater Control Temperature Parameter	TC	Y
(245,42)	Set LO Laser Parameter Set	TC	Y
(245,43)	Set TX Laser Parameter Set	TC	Y

5.21.6 Service 246: LCT Target Trajectory Management Service

ID	Name	Type	LCT
(246,10)	Report LCT Target Trajectory Parameter	TC	Y
(246,11)	LCT Target Trajectory Parameter Report	TM	Y
(246,12)	Set LCT Target Trajectory Parameter	TC	Y

5.21.7 Service 247: LCT Launch Lock Release Mode Service

ID	Name	Type	LCT
(247,1)	Switch On Nominal CPA Launch Lock Heater Power	TC	Y
(247,2)	Switch On Nominal BAPS Az & EI Heater Powers	TC	Y
(247,3)	Perform CPA Az & EI Current Measurement	TC	Y
(247,4)	Start Automatic Launch Lock Release Operating Sequence	TC	Y
(247,5)	CPA Az & EI Current Measurement Report	TM	Y

6 PUS SERVICES DETAILS

In general, the specified Service Type/Subtype Data fields having the same name as used in PUS [AS.01] are to be considered to have the same definition as [AS.01].

The general layout used throughout Section 6 for the definitions of individual telecommand and telemetry packets are shown in Figure 6-1 and Figure 6-2 respectively. The details of the Packet Header is omitted while the Data Field Header is simplified showing only the values of the Service Type and Service Subtype numbers. The main focus is on the relevant Application Data field structure of the telecommand packet and the Source Data field structure of the telemetry packet.

For readability reasons the message parameters are shown in a list format to provide equal space to each parameter regardless of its actual size. The parameter position in the message is given by the word number on the left, while the parameter size is given on the right. The parameter is left-justified, that is, stacked on the most significant side of the word.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (Type, Subtype)	2 words
	Application Data	variable
M	Packet Error Control	1 word

Figure 6-1: Telecommand Packet General Layout

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (Type, Subtype)	5 words

Figure 6-2: Telemetry Packet General Layout

6.1 SERVICE 1: TELECOMMAND VERIFICATION

6.1.1 TM (1, 1) Telecommand Acceptance Report – Success

TM (1,1) report is generated if the corresponding ACK flag was set in the TC. The report informs the TC source about the successful reception of the TC by the receiving onboard application (APID).

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (1,1)	5 words

6.1.2 TM (1, 2) Telecommand Acceptance Report – Failure

TM (1,2) report is generated if the acceptance check of a TC failed. Each application process provides a TC acceptance failure report independent from the ACK flag settings. It indicates the reason for the failure in the Code field and provides the indication of the Parameter found in error. An additional field, the Complimentary Information, can provide further information related to the failure report.

Word N°	Parameter	Size

6.1.9 TC (1, 128) Enable Successful Telecommand Verification Report

TC(1,128) and TC(129) allows to modify the acknowledgement flags for hard-coded TC stored on-board (i.e. OBCD TC). A global Boolean variables is defined which can be updated by Ground. Its value determine whether the acceptance acknowledgement is to be generated or not.

The global boolean status will be ANDed with the ACK flag status.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (1,128)	2 words
6	Packet Error Control	1 word

NM ASW	None
SM ASW	None

6.1.11 TC (1, 160) Assign Internal TC Acknowledgement Flags

TC(1,160) instructs the SES to assign the Acceptance and Execution Complete Acknowledgement Flags in the packet headers for internally generated telecommands as specified in this telecommand. These flags control whether a telecommand will generate the (1,1) and (1,7) telemetry packets to acknowledge successful Acceptance or Execution Complete. They do not affect the generation of failure reports.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (1,160)	2 words
6	Spare	14 bits
6	Internal TC Acceptance Report Flag	1 bit
6	Internal TC Execution Complete Report Flag	1 bit
7	Packet Error Control	1 word

ICM	None

6.2 SERVICE 2: DEVICE COMMANDING

Direct HPC1 commands (i.e. no SW involvement) are defined in section 3.3. While in this section, all the services involve software.

All On/Off commands are either performed through the CPDU function or through 1553B Bus commands to the EPS PCPU and CAPS.

6.2.1 TC (2, 144) Distribute CPDU TC Packet(s)

TC (2,144) requests the ASW to activate the HPC2 command(s) by dispatching CPDU TC Packet command(s) contained in TC(2,144).

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (2,144)	2 words
6	Length of CPDU TC Packet-1	1 byte
6	Length of CPDU TC Packet-2	1 byte
7..M-1	CPDU TC Packet-1 (*)	variable
M..N-1	CPDU TC Packet-2 (*)	variable
N	Packet Error Control	1 word

Figure 6.2.1-1: TC (2,144) Distribute CPDU Commands

(*) – CPDU TC Packet format shown in Figure 3.3-1.

Note: The two CPDU commands have to be addressed to the two CPDU. TC(2,144) also supports one CPDU command this is achieved by having the "Length of CPDU TC Packet-2 = 0. The ASW dispatches the CPDU command based on the APID

TC (2,144) Applicability	TC (2,144) Format Deviations
NM ASW	None
SM ASW	None

6.3 SERVICE 3: PERIODIC REPORTING

6.3.1 TC (3, 1) Define New Housekeeping Parameter Report

Upon reception of TC (3,1) a new HK Report Definition is created in the onboard system.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (3,1)	2 words
6	SID	1 word
7	Collection Interval	1 word
8	Collection Offset	1 word
9	NPAR1	1 word
10..11	Parameter #	2 words
	P repeated NPAR1-1 times	variable
N	Packet Error Control	1 word

Figure 6.3.1-1: TC (3, 1) Define New Housekeeping Parameter Report

TC (3,1) Applicability	TC (3,1) Format Deviations
NM ASW	None
SM ASW	None

6.3.2 TC (3, 2) Define New Diagnostic Parameter Report

Upon reception of TC (3,2) a new Diagnostic Report Definition is created in the onboard system. It is possible with TC (3,2) to support super-commutation.

Word N°	Parameter	Size	
1..3	Packet Header	3 words	
4..5	Telecommand ID (3,2)	2 words	
6	SID	1 word	
7	Collection Interval	1 word	
8	Collection Offset	1 word	
9	NPAR1	1 word	
10..11	Parameter #	2 words	P
12..M	P repeated NPAR1-1 times	variable	
M+1	NFA	1 word	
M+2	NREP	1 byte	
M+2	NPAR2	1 byte	
M+3..M+4	Parameter #	2 words	R S
	R repeated NPAR2-1 times	variable	
	Block S repeated NFA-1 times	variable	
N	Packet Error Control	1 word	

Figure 6.3.2-1: TC (3, 2) Define New Diagnostic Parameter Report

Note:

- The ASW requires the Collection Interval to be specified in Time Slice (i.e. TS = 125 ms) and must be multiple of 2 up to 16 seconds (i.e. 128 TS). The Collection Interval divided by the NREP must be an integer (e.g. if Collection Interval is 8 then NREP can be either 1, 2, 4 or 8).
- The ICM NREP defines the number of times the Parameter # in a fixed length array have to be sampled within the associated collection interval. NREP can be 2, 4, 8, 16 or 32. NPAR2 defines the number of Parameters # contained in a fixed length array. NPAR2 can be 1..16. The Collection Interval specifies the time interval between successive report packets and can be 0.25, 0.5, 1, 2, 4, 8, 16 or 32 sec which are coded as 0, 1, 2, 3, 4, 5, 6 and 7 respectively.

TC (3,2) Applicability	TC (3,2) Format Deviations
NM ASW	None
SM ASW	None
ICM	None
LCT	Same format except that Collection Offset field is not supported and it is replaced by a Spare word. Also LCT supports only one fixed length array i.e. NFA is always set to "1".

6.3.3 TC (3, 3) Clear Housekeeping Parameter Report Definitions

Upon reception of TC (3,3) the HK Report Definition specified by the SID number is removed from the onboard system.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (3,3)	2 words

M+3..M+4	Parameter #	2 words	R S
	R repeated NPAR2-1 times	variable	
	Block S repeated NFA-1 times	variable	
N	Packet Error Control	1 word	

Figure 6.3.10-1: TM (3, 10) HK Parameter Report Definitions Report

Note: When generating multiple TM packet reports, each of the generated packets shall always be self contained. This means that losing individual packets will not result in adjacent packets being invalidated, as each TM packet contains a complete subset of data. However all of the TM packets must be received to determine the correct complete TM report. Missing packets may be determined by checking the Report Integrity Counter. The counts should be consecutive. If the last packet is "lost", then the Last Packet flag will not be received.

Word N°	Parameter	Size	
1..3	Packet Header	3 words

Figure 6.6.4-2: ASW TC (6,5) Dump Memory using Absolute Addresses

TC (6,5) Applicability	TC (6,5) Format Deviations
NM ASW	Additional "Spare" word between "Start Address" and "Length" fields as shown in Figure 6.6.4-2. (Note: Same format as TC(6,3)).
SM ASW	Same as NM ASW.
ICM	None
ICM BOOT	Supports only the dump of a single contiguous area of memory, i.e. N = 1.
TCU	None
DSHA	None
DSHA BOOT	None
LCT	Supports only the dump of a single contiguous area of memory, i.e. N = 1.

6.6.5 TM (6, 6) Memory Dump using Absolute Addresses Report

TM (6,6) is the response to TC (6,5).

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (6,6)	5 words
9	Last Packet	1 bit
9	Report Integrity Counter	15 bits
10	Memory ID	1 word
11..12	Start Address	2 word
13	Length	1 word
14..N-1	Data	variable
N	Packet Error Control	1 word

Figure 6.6.5-1: TM (6,6) Memory Dump using Absolute Addresses Report

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (6,6)	5 words
9	Last Packet	1 bit
9	Report Integrity Counter	15 bits
10	Memory ID	1 word
11	N	1 word
12..13	Start Address	2 word
14	Length	1 word
	Data	variable
	Block R repeated N-1	variable
N	Packet Error Control	1 word

Figure 6.6.5-2: TCU TM (6,6) Memory Dump using Absolute Addresses Report

Note: When generating multiple TM packet reports, each of the generated packets shall always be self contained.

TM (6,6) Applicability	TM (6,6) Format Deviations
NM ASW	No PEC
SM ASW	No PEC
ICM	None
ICM BOOT	None
TCU	TCU reports non-contiguous memory areas in different packets. However TCU TM(6,6) includes the parameter "N" which has always the value "1".
DSHA	
DSHA BOOT	
LCT	Supports only the dump of a single continuous area of memory, i.e. N = 1.

6.6.6 TC (6, 9) Check Memory using Absolute Addresses

TC (6,9) requests a checksum report.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (6,9)	2 words
6	Memory ID	1 word
7..8	Start Address	2 word
9..10	Length 6 9	2 word
11	Packet Error Control	1 word

Figure 6.6.6-1: TC (6,9) Check Memory using Absolute Addresses

NM ASW	None
SM ASW	None
ICM	None
ICM BOOT	None
TCU	None
DSHA	None
DSHA BOOT	None
LCT	None

6.6.7 TM (6, 10) Memory Check using Absolute Addresses Report

TM (6,10) is the response to TC (6,9).

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (6,10)	5 words
9	Memory ID	1 word
10..11	Start Address	2 word
12..13	Length_6_9	2 words
14	Checksum	1 word
15	Packet Error Control	1 word

Figure 6.6.7-1: TM (6,10) Memory Check using Absolute Addresses Report

TM (6,10) Applicability	TM (6,10) Format Deviations
NM ASW	No PEC
SM ASW	No PEC
ICM	None
ICM BOOT	None
TCU	None except that for the Checksum parameter where the TCU uses the CRC algorithm according to ECSS PUS Annex A1 and not the ISO algorithm according to ECSS PUS Annex A2.
DSHA	None
DSHA BOOT	None
LCT	None

6.6.8 TM (6, 144) Physical Address Resolution Report

TM (6,144) is generated in response to TC (6,3) for each base plus offset scattered dump before the TM (6,145).
TM (6,144) is also generated in response to TC (6,1) for each base plus offset scattered load.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (6,144)	5 words
9..10	Base ID	2 words
11	Offset	1 word
12..13	Start Address	2 word

Figure 6.6.8-1: TM (6,144) Physical Address Resolution Report

TM (6,144) Applicability	TM (6,144) Format Deviations
NM ASW	None
SM ASW	None

6.6.9 TM (6, 145) Memory Dump using Base plus Offset Report

TM (6,145) is the response to TC (6,3). Before the generation of TM (6,145), TM (6,144) is generated which reports the physical address correspondence of the Base ID.

TM (6,145) includes the physical address and not the "Base ID" and "Offset" as PUS TM (6,4). TM (6,145) substitutes PUS TM (6,4).

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..8	Telemetry ID (6,145)	5 words
9	Last Packet	1 bit
9	Report Integrity Counter	15 bits
10	Memory ID	1 word
11..12	Start Address	2 word
13	Length	1 word
14..N	Data	variable

6.8 SERVICE 9: ON-BOARD TIME MANAGEMENT

6.8.1 TC (9, 1) Change Time Report Generation Rate – Not Supported

The Time report is generated every Nth VC0 frame, where the default rate is hardware configurable through a PROM configuration parameter. The PROM value is set for the generation of a Time report every 16 VC0 TM transfer frames.

It is not envisaged to change the Time report rate in flight, and as a consequence there is no need of TC(9,1) service.

6.8.2 TM (9, 2) Time Report

The Time Packet format is reported in section 4.5.

The Time Packet has no PUS standard Data Field Header. The Time Packet reported in section 4.5 covers TM (9,2) Time Report service.

6.8.3 TC (9, 144) Set Delta OBT

TC (9, 144) used to set the SW variable to be added to the hardware counter. It can only set seconds and not sub-seconds.

NOTE: The hardware OBT counter can be set using TC(6, 149) Register Load.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (9,144)	2 words
6..8	Delta OBT	3 words
9	Packet Error Control	1 word

NM ASW	None
SM ASW	None

6.9.4 TC (11, 4) Insert TC in Time-Tagged Schedule

Upon reception of TC (11,4) the TT-TC contained in the TC Packet Data Field are inserted in the Time-Tagged Schedule. TT-TC in the command schedule are ordered with increasing time tag. TT-TC with identical time tag are sorted in the sequence they are received. The resolution of the Time-Tags is given by the format of the spacecraft time. However, the execution accuracy of the TT-TC is less than the Time Tag resolution itself.

The format of TC (11,4) is specified in section 3.5 Figure 3.5-1.

TC (11,4) Applicability	TC (11,4) Format Deviations
NM ASW	None
SM ASW	None

6.9.5 TC (11, 5) Delete TC from Time-Tagged Schedule

Upon reception of TC (11,5) all TT-TC which satisfy the selection criteria defined by the APID, Sequence Count and the Number of TC are deleted.

TC (11,5) allows to delete a number of successive telecommands with the same APID starting from the specified Sequence Count and following the execution time ordered list.

Word N°	Parameter	Size
1..3	Packet Header	3 words
4..5	Telecommand ID (11,5)	2 words

ICM	None
TCU	None
DSHA	None

6.10.3 TC (12, 225) Add Parameters to Monitoring List

TC(12,225) allows to add one or more Parameters to the onboard Parameter Monitoring List. A Parameter ID may have either a Limit Check or an Expected Value Check defined, not a combination of both. The maximum number of Check Definitions, that is the maximum value of either NOL or NOE, assigned to a Parameter ID is 1 for the DSHA.

For a single parameter, the following information is included in a parameter monitoring definition:

- How many consecutive failed checks are necessary to start a recovery (OOL Number)
- If the recovery action is enabled or not (Recovery Action)
- For each limit (LL, HL or EV) the associated Report ID in case of OOL detection (optional).

Word N°	Parameter	Size	
1..3	Packet Header	3 words	R1
4..5	Telecommand ID (12,225)	2 words	
6	NPAR	1 word	
7.8	Parameter #	2 words	
9	Recovery Action	1 bit	
9	OOL Number	4 bits	
9	Spare = 0	11 bits	
10	NOL	1 word	
	Optional Parameters: If NOL = 0, these parameters are omitted.		
	NOE	1 word	
	Optional Parameters: If NOE = 0, these parameters are omitted.		Limit Check
	Block R1 repeated NPAR-1 times	variable	
M	Packet Error Control	1 word	

When NOL = 1, the Limit Check will be structured as:

	Low Limit #	2 words
	LL RID #	1 word
	High Limit #	2 words
	HL RID #	1 word

When NOE = 1, the Expected Check will be structured as:

	Expected Value #	2 words
	EV RID #	1 word

ICM	None
TCU	None

6.10.23 TC (12, 161) Add Parameters to Monitoring List

TC(12,161) instruct the SES to add one or more Parameter # to the onboard Parameter Monitoring List. A Parameter # may have either a Limit Check or an Expected Value Check defined, not a combination of both. A Parameter # may only have one Check Definition per Mode. The Check Selection parameter is used to specify the Modes for which the associated Check Definition applies. It can be used to specify a single Mode or a combination of Modes. By default Parameters added to the monitoring list have their Check Definitions set to Disabled.

Word N°	Parameter	Size	R1	Limit Check	Expected Check
1..3	Packet Header	3 words			
4..5	Telecommand ID (12,161)	2 words			
6	N	1 word			
7	Parameter Monitoring Interval	8 bits			
7	Acquisition Slice	8 bits			
8..9	Parameter #	2 words			
10	NOL	1 word			
	Optional Parameters: If NOL = 0, these parameters are omitted.				
	NOE	1 word			
	Optional Parameters: If NOE = 0, these parameters are omitted.				
	Block R1 repeated N-1 times	variable			
M	Packet Error Control	1 word			

When NOL = 1 to 7, the Limit Check will be structured as:

	ICM Check Selection	1 word
	Low Limit	2 words
	RID	1 word
	High Limit	2 words
	RID	1 word

When NOE = 1 to 7, the Expected Check will be structured as:

	ICM Check Selection	1 word
	Expected Value	2 words
	RID	1 word

6.10.25 TC (12, 163) Modify Parameter Checking Information

TC (12,163) instructs SES to delete or modify one or more check definitions associated to a Parameter. If the Check Position value is -1, the Check Definitions for the Modes given by the associated Check Selection parameter will be deleted; if the Check Position is +1, the specified Check Definitions will be applied for the Modes in accordance with the associated Check Selection parameter.

Note that the last Check Definition for a Parameter can not be deleted using TC(12,163), the TC(12,6) must be used instead.

Word N°	Parameter	Size	
1..3	Packet Header	3 words	
4..5	Telecommand ID (12,163)	2 words	
6	N_12_7	1 word

ICM	None

6.10.26 TC (12, 227) Modify Parameter Checking Information

TC(12,227) allows to modify the Check Definition associated to a selected Parameter. The number of parameters whose entry in the monitoring list can be modified will be limited to a maximum of MONLIST_MAX_PARAMS supported by the DSHA. The maximum number of Check Definitions, that is effectively the maximum value of either NOL or NOE, assigned to a Parameter ID is defined by the mission constant MONLIST_MAX_CHECKS: for the DSHA the max number of check Definitions is 1.

For a single parameter, the following information is included in a parameter monitoring definition:

- How many consecutive failed checks are necessary to start a recovery (OOL Number)
- If the recovery action is enabled or not (Recovery Action)
- The specified limits (LL and HL) or expected value (EV) applicable.
- For each limit (LL, HL or EV) the associated Report ID in case of OOL detection (optional).

Note: The last Check Definition for a Parameter cannot be deleted using TC(12,227), the TC(12,6) Delete Parameters from Monitoring List must be used instead.

Word N°	Parameter	Size	
1..3	Packet Header	3 words	
4..5	Telecommand ID (12,227)	2 words

DSHA	None

6.13.20 TC (15, 228) Downlink

TC(15,228) requests to start down-linking a specified sequence of packet stores maintaining the same carrier. The selected Number of Sectors starting from the first Packet Store specified in the TC. When the total content of the Packet Store has been downloaded, the DSH passes to downlink the next Packet Store present in the TC. The execution will continue up to one of the following events will be verified:

- No other Packet Store to downlink
- Number of Sectors to downlink specified in the TC has been reached.

6.17.4 Service 133: Two-Step Telecommand Service

The Two Step Telecommand service implements the Arm and Fire protocol. When the Arm TC is received by the ASW the TC is not executed but only arms the TC waiting for the associated Fire TC. When the associated Fire TC is received, the ASW dispatches the TC for execution.

Only one Two-Step TC is managed at any one time. An Arm TC is discarded if received when another Arm TC is already stored. Similarly, a Fire TC is discarded when received without an Arm TC present. The Arm TC is also deleted after a time-out without the reception of a Fire TC.

6.17.4.1 TC (133,1) Arm Telecommand

TC(133,1) requests to store onboard the embedded TC to be armed.

6.17.5 Service 134: Telecommand Batch Management Service

AVS Telecommand Batch Management service is used for the upload of a batch of telecommands for immediate execution. The format of AVS TC (134,1) is shown in section 3.7 figure 3.7-1. The maximum number of telecommands which can be grouped with a TC (134,1) is only limited to the maximum size of TC (134,1), that is 256 words.

TC (134,1) embedded telecommands (TC Packet-1, TC Packet-2 ...) will be executed in the same order as they appear in the TC (134,1) except if a telecommands address different PID where the execution order is no longer guaranteed.

6.17.5.1 TC (134,1) Execute Telecommand Batch

TC(134,1) commands to execute all the embedded TC after successful TC(134,1) checks. The embedded TC are all dispatched to the destination PID(s) in the order provided.

Word N°	Parameter	Size
1..3	Packet Header	3 words

6.18 GPSR MISSION SPECIFIC SERVICES

6.18.1 Service 210: Mode Service

6.18.1.1 TC (210,1) Change GPSR Mode

TC(210) request a GPSR mode change. The mode changes are:

- Mode change into Startup mode
- Mode change into Standby mode.
- Mode change into Navigation mode
- Mode change hold Startup

Refer to [RD.04], Sentinel GPSR command and Housekeeping Data Interface, for the detailed format and definition of TC(210,1).

6.18.2 Service 211: Parameter Service

6.18.2.1 TC (211,1) Load GPSR Parameter

TC(211,1) pre-loads new parameters in the Standby and Navigate mode of the GPSR. The parameters loaded in Standby mode become effective in the frame of the mode transition from Standby to Navigate. Refer to [RD.04] for details of the parameter handling in the different GPSR modes.

Refer to [RD.04] for the detailed format and definition of TC(211,1).

6.18.2.2 TC (211,2) Report GPSR Parameter

TC(211,2) requests a report of parameters, either pre-loaded or already effective. The Function ID determines the type of data records to be reported.

Refer to [RD.04] for the detailed format and definition of TC(211,2).

6.18.2.3 TM (211,3) GPSR Parameter Report

In response to TC(211,2), TM(211,3) reports the requested parameters identified through the specified Function ID. The Function ID determines the type of data records being reported, and implicitly also the format of those data records.

Refer to [RD.04] for the detailed formats and definitions of TC(211,3).

6.18.3 Service 212: Science Data Service

6.18.3.1 TM (212,1) GPSR Science Data

The Science Data sets reported in TM(212,1) packets with specific SID values and that are part of either the nominal or diagnostic set include (TBC):

- TM(212,1) SID E200 H Carrier Amplitude Packet - [RD.05] SID 226 (i.e. E2 H)
- TM(212,1) SID E100 H Carrier Phase Packet - [RD.05] SID 225 (i.e. E1 H)
- TM(212,1) SID E300 H Code Phase Packet - [RD.05] SID 227 (i.e. E3 H)
- TM(212,1) SID D800 H Minimum Navigation Solution Packet - [RD.05] SID 216 (i.e. D8 H)
- TM(212,1) SID D900 H IMT/GPST Correlation Packet - [RD.05] SID 217 (i.e. D9 H)
- TM(212,1) SID DA00 H Auxiliary Data Packet - [RD.05] SID 218 (i.e. DA H)
- TM(212,1) SID DF00 H Satellites in View Status Packet - [RD.05] SID 223 (i.e. DF H)
- TM(212,1) SID E000 H Channel Status Packet - [RD.05] SID 224 (i.e. E0 H)
- TM(212,1) SID E400 H Noise Histogram Data Packet - [RD.05] SID 228 (i.e. E4 H)

Refer to [RD.05], Sentinel GPSR Measurement Data Interface, for the full list of TM(212,1) packets and for the detailed formats and definitions of the TM(212,1) packets.

Note: [RD.05] defines an 8-bit SID field and the next least significant 8-bits as a Filler field = 0. Sentinel-1 GPSR SID is seen by the ASW a 16-bit SID where the two [RD.05] stated fields compose the SID. That is, [RD.05] SID = E2 H becomes Sentinel-1 GPSR SID = E200 H.

6.18.4 Service 213: Periodical Memory Service

6.18.4.1 TC (213,1) Periodical Memory Diagnosis

For diagnostic purposes TC(213,1) service allows to report the contents of a set of scattered memory locations in RAM at a fixed rate of 1 Hz and at a well defined point in time (the PPS leading edge). Upon successful receipt of this TC, the GPSR replies with a TM(1,1) and consequently one Periodical Memory Diagnosis Report is generated every second. The service can be aborted with TC(213,3).

Refer to [RD.04], Sentinel GPSR command and Housekeeping Data Interface, for the detailed format and definition of TC(213,1).

6.18.4.2 TM (213,2) Periodical Memory Diagnosis Report

In response to TC(213,1), TM(213,2) reports the periodic memory dumps of the requested memory locations.

Refer to [RD.04] for the detailed format and definition of TM(213,2).

6.18.4.3 TC (213,3) Abort Memory Service

TC(213,3) allows to stop the memory service without changing the GPS receiver mode.

Refer to [RD.04] for the detailed format and definition of TC(213,3).

6.19 C-SAR MISSION SPECIFIC SERVICES

6.19.1 Service 152: SES Function Management

6.19.1.1 TC (152,160) Change Mode To Standby

TC(152,160) instruct the SES to perform a transition to Standby Mode.

Refer to [RD.02] for details on TC(152,160).

6.19.1.2 TC (152,161) Change Mode To Pause

TC(152,161) instruct the SES to perform a transition to Pause Mode.

Refer to [RD.02] for details on TC(152,161).

6.19.1.3 TC (152,162) Change Mode To Ready

TC(152,162) instruct the SES to perform a transition to Ready Mode.

Refer to [RD.02] for details on TC(152,162).

6.19.1.4 TC (152,163) Change Mode To Standby Refuse

TC(152,163) instruct the SES to perform a transition to Standby Refuse Mode.

Refer to [RD.02] for details on TC(152,163).

6.19.1.5 TC (152,164) Perform Measurement

TC(152,164) instruct the SES to perform a transition to Measurement Mode.

Refer to [RD.02] for details on TC(152,164).

SES TC(152,164) includes in the data field the parameter 'Measurement Start Time', which is the precise acquisition start time (in instrument OBT coordinates).

Ground is allowed to uplink TC(152,164) as either an immediate TC or as a time-tag TC or as a position tag TC as for all other S/C TC. TC(152,164) sent as an immediate TC could be used for test purposes on ground.

For the case Ground loads TC(152,164) as a time-tagged command by means of AVS TC(11,4) 'Insert TC in time tag schedule', then AVS will dispatch the TC to the SES at the expiration of the time-tag.

Hence for the cases of immediate and time-tag dispatching, the TC(152,164) format with the parameter 'Measurement Start Time' is that sent by Ground and processed by SES, shown in Figure 6.19.1.5-1 and Figure 6.19.1.5-4.

For the nominal case, Ground loads TC(152,164) as a position-tagged command by means of AVS TC(132,4) 'Insert TC in position tag schedule', AVS processes and dispatches the TC when the orbital position tag is reached. TC(152,164) words 6 to 8 must contain the 'Measurement Start Position' instead of the 'Measurement Start Time' parameter as shown in Figure 6.19.1.5-2. The 'Measurement Start Position' specifies the orbital position where the precise acquisition must start. The 'Measurement Start Time' expected by SES in the received TC(152,164) is computed by AVS from the 'Measurement Start Position' specified by Ground. SES always interprets words 6 to 8 of an incoming TC(152,164) as start time.

Hence a TC(152,164) loaded as a position-tagged command by means of AVS TC(132,4) must be specified with a fine measurement start position in the field 'Measure Start Position' shown in Figure 6.19.1.5-2 and Figure 6.19.1.5-3. The AVS computation of the corresponding 'Measurement Start Time' parameter is performed by the AVS when the TC(152,164) specified 'coarse' orbital position through TC(132,4) is reached and before dispatching the TC(152,164) to SES.

Figure 6.19.1.5-4: "Measurement Start Time" format

6.19.1.6 TC (152,165) Release Refuse

TC(152,165) instruct the SES to exit from whatever Refuse mode it is currently in, back to a normal mode.

Refer to [RD.02] for details on TC(152,165).

6.19.1.7 TC (152,166) Set ECC Program Parameters

TC(152,166) instruct the SES to update the specified ECC Program with the ECC Entries and ECC Instructions defined in the telecommand. .

Refer to [RD.02] for details on TC(152,166).

6.19.1.8 TC (152,167) Set Beam Steering Table Parameters

TC(152,167) instruct the SES to write a block of BST Entries to a specified Beam Steering Table beginning at the BST Entry Number given in the telecommand..

Refer to [RD.02] for details on TC(152,167).

6.19.1.9 TC (152,168) Set SWST Parameters

TC(152,168) instruct the SES to update the specified Swath in the Radar Parameter Database with the SWST values defined in the telecommand. Each SWST value defines a change to be applied during an orbit at the associated *Orbit Swath Data Window*. Each orbit location can only be associated with one SWST value.

Refer to [RD.02] for details on TC(152,168).

6.19.1.10 TC (152,169) Set Swath Elevation Address

TC(152,169) instruct the SES to update the specified Swath in the Radar Parameter Database with the defined Elevation Address.

..

Refer to [RD.02] for details on TC(152,169).

6.19.1.11 TC (152,170) Set Rank and PRI Duration Parameters

TC(152,170) instruct the SES to update the specified Swath in the Radar Parameter Database with the defined in the telecommand. This defines a change of values to occur during an orbit at the time specified by the associated Orbit Swath Data Window.

Refer to [RD.02] for details on TC(152,170).

6.19.1.12 TC (152,171) Set Tx Pulse Parameters

TC(152,171) instruct the SES to update the specified Pulse Number in the Tx Pulse Database with the parameters defined in the telecommand.

Refer to [RD.02] for details on TC(152,171).

6.19.1.13 TC (152,172) Set Mission Specific Parameters

TC(152,172) instruct the SES to update the Mission Timing Parameters with the specified timing coefficient values.

Refer to [RD.02] for details on TC(152,172).

6.19.1.14 TC (152,173) Set PRI Parameters

TC(152,173) instruct the SES to update the 32 PRI's with the values specified in the telecommand.

Refer to [RD.02] for details on TC(152,173).

6.19.1.15 TC (152,174) Send Direct Power Switching Command

TC(152,174) instruct the SES to execute a power switching command internal to the SES.

Refer to [RD.02] for details on TC(152,176).

6.19.1.16 TC (152,175) Send CAN Message

TC(152,175) instruct the SES to send the specified Message via both Antenna Control Busses (ACB)..

Refer to [RD.02] for details on TC(152,175).

6.19.1.17 TM (152,176) CAN Message Response Report

SES will generate TM(152,176) in response to a valid TC(152,175) request to send a CAN message that generates a response message.

Refer to [RD.02] for details on TM(152,176).

6.19.1.18 TC (152,177) Send SpaceWire Message

TC(152,177) instruct the SES to send the specified Message via the SpaceWire bus..

Refer to [RD.02] for details on TC(152,177).

6.19.1.19 TM (152,178) SpaceWire Message Response Report

SES will generate TM(152,178) in response to a valid TC(152,177) that sends a SpaceWire message resulting in the response message.

Refer to [RD.02] for details on TM(152,178).

6.19.1.20 TC (152,179) Clear Radar Parameter Data

TC(152,179) instruct the SES to clear all parameter data for an element of the Radar Parameter Database. The action of clearing will set all data entries to zero or the equivalent default value and the status within the Database will be set to Undefined.

Refer to [RD.02] for details on TC(152,179).

6.19.1.21 TC (152,182) Perform Test

TC(152,182) instruct the SES to generate a transition to Test Mode.

Refer to [RD.02] for details on TC(152,182).

6.19.1.22 TC (152,183) Report Radar Parameters

TC(152,183) instruct the SES to generate a Telemetry packet, or packets, to report the values of the requested element from the Radar Parameter Database..

Refer to [RD.02] for details on TC(152,183).

6.19.1.23 TM (152,184) ECC Parameters Report

SES generates TM(152,184) in response to a valid TC(152,183) request to report the values for a particular ECC Program defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,184).

6.19.1.24 TM (152,185) BST Parameters Report

SES generates TM(152,185) in response to a valid TC(152,183) request to report the values for a particular Beam Steering Table defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,185).

6.19.1.25 TM (152,186) Rank and PRI Duration Parameters Report

SES generates TM(152,186) in response to a valid TC(152,183) request to report the Rank and PRI Duration values for a particular Swath defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,186).

6.19.1.26 TM (152,187) SWST Parameters Report

SES generates TM(152,187) in response to a valid TC(152,183) request to report the values for a particular Swath defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,187).

6.19.1.27 TM (152,188) Tx Pulse Parameters Report

SES generates TM(152,188) in response to a valid TC(152,183) request to report the values for a particular Tx Pulse defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,188).

6.19.1.28 TM (152,189) PRI Parameters Report

SES generates TM(152,189) in response to a valid TC(152,183) request to report the PRI values defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,189).

6.19.1.29 TM (152,190) Mission Specific Parameters Report

SES generates TM(152,190) in response to a valid TC(152,183) request to report the Mission Specific Parameter values defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,190).

6.19.1.30 TC (152,191) Set Instrument Redundancy Configuration

TC(152,191) instruct the SES to use the specified redundancy configuration for the SAS Antenna during Measurement Mode.

Refer to [RD.02] for details on TC(152,191).

6.19.1.31 TC (152,192) Enable Memory Scrubber

TC(152,192) instruct the SES to enable the Memory Scrubber.

Refer to [RD.02] for details on TC(152,192).

6.19.1.32 TC (152,193) Disable Memory Scrubber

TC(152,193) instruct the SES to disable the Memory Scrubber.

Refer to [RD.02] for details on TC(152,193).

6.19.1.33 TC (152,194) Set SWL Parameters

TC(152,194) instruct the SES to update the specified Swath in the Radar Parameter Database with

the parameters defined in the telecommand. This defines a change of values to occur during an orbit at the time specified by the associated Orbit Swath Data Window.

Refer to [RD.02] for details on TC(152,194).

6.19.1.34 TC (152,195) Set Rx Gain Parameters

TC(152,195) instruct the SES to update the specified Swath in the Radar Parameter Database with the parameters defined in the telecommand. This defines a change of values to occur during an orbit at the time specified by the associated Orbit Swath Data Window.

Refer to [RD.02] for details on TC(152,195).

6.19.1.35 TC (152,196) Set Tx Pulse and Rx Bandwidth Parameters

TC(152,196) instruct the SES to update the specified Swath in the Radar Parameter Database with the parameters defined in the telecommand. This defines a change of values to occur during an orbit at the time specified by the associated Orbit Swath Data Window.

Refer to [RD.02] for details on TC(152,196).

6.19.1.36 TM (152,197) SWL Parameters Report

SES generates TM(152,197) in response to a valid TC(152,183) request to report the SWL values for a particular Swath defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,197).

6.19.1.37 TM (152,198) Rx Gain Parameters Report

SES generates TM(152,198) in response to a valid TC(152,183) request to report the Rx Gain (co- and Cross-Polarisation) values for a particular Swath defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,198).

6.19.1.38 TM (152,199) Tx Pulse and Rx Bandwidth Parameters Report

SES generates TM(152,199) in response to a valid TC(152,183) request to report the Tx Pulse and Rx Bandwidth values for a particular Swath defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,199).

6.19.1.39 TC (152,200) Enable Swath Parameter Updates

TC(152,200) instruct the SES to perform Swath Parameter updates during Measurement Modes.

Refer to [RD.02] for details on TC(152,200).

6.19.1.40 TC (152,201) Disable Swath Parameter Updates

TC(152,201) instruct the SES to disable updates to Swath Parameters during Measurement Modes.

Refer to [RD.02] for details on TC(152,201).

6.19.1.41 TC (152,202) Save Radar Database Data

TC(152,202) instruct the SES to copy an element of the Radar Parameter Database from RAM into EEPROM.

Refer to [RD.02] for details on TC(152,202).

6.19.1.42 TC (152,203) Save Instrument Redundancy Configuration Data

TC(152,203) instruct the SES to save the Instrument Redundancy Configuration Data to EEPROM.

Refer to [RD.02] for details on TC(152,203).

6.19.1.43 TC (152,204) Request EQSOL

TC(152,204) only sets the corresponding EQSOL request flag in the CCA. As a consequence the AVS on detection of the EQSOL request will send the EQSOL discrete command to the SES as a pre-warning of the switch-down. Only then the C-SAR will perform the necessary action prior to the AVS executing the EQSOL switch-down.

Refer to [RD.02] for details on TC(152,204).

6.19.1.44 TC (152,205) Send Serial Message

TC(152,205) instruct the SES to send the specified Message via the CAPS Control bus.

Refer to [RD.02] for details on TC(152,205).

6.19.1.45 TM (152,206) Serial Message Response Report

SES will generate TM(152,206) in response to a valid TC(152,205) request to send a serial message that generates a response message.

Refer to [RD.02] for details on TM(152,206).

6.19.1.46 TC (152,207) Change Mode To Pause Refuse

TC(152,207) instruct the SES to perform a transition to Pause Refuse Mode.

Refer to [RD.02] for details on TC(152,207).

6.19.1.47 TC (152,208) Enable Watchdog

TC(152,208) instruct the SES to enable the hardware Watchdog functionality of the Interface Control Module (ICM).

Refer to [RD.02] for details on TC(152,208).

6.19.1.48 TC (152,209) Disable Watchdog

TC(152,209) instruct the SES to disable the hardware Watchdog functionality of the Interface Control Module (ICM).

Refer to [RD.02] for details on TC(152,209).

6.19.1.49 TC (152,210) Set Instrument Configuration Identifier

TC(152,210) instruct the SES to use the specified value as the Instrument Configuration Identifier.

Refer to [RD.02] for details on TC(152,210).

6.19.1.50 TC (152,211) Report Instrument Redundancy Configuration

TC(152,211) instruct the SES to generate a Telemetry packet to report the Instrument Redundancy settings.

Refer to [RD.02] for details on TC(152,211).

6.19.1.51 TM (152,212) Instrument Redundancy Configuration Report

SES will generate TM(152,212) in response to a valid TC(152,211) request to report the Instrument Redundancy settings.

Refer to [RD.02] for details on TM(152,212).

6.19.1.52 TC (152,213) Report Software Information Report Table

TC(152,213) instruct the SES to generate a Telemetry packet to report the Software Information Report Table. The Reset Flag allows the various counters and performance indicators to be reset immediately after the report has been generated.

Refer to [RD.02] for details on TC(152,213).

6.19.1.53 TM (152,214) Software Information Report Table Report

SES will generate TM(152,214) in response to a valid TC(152,213) request to report the Software Information Report Table. The Table typically contains status flags, error counters, performance indicators and other parameters.

Refer to [RD.02] for details on TM(152,214).

6.19.1.54 TC (152,215) Reset ICM

TC(152,215) instruct the SES to perform a warm reset of the ICM processor board.

Refer to [RD.02] for details on TC(152,215).

6.19.1.55 TC (152,216) Execute Application

TC(152,216) instruct the SES to immediately start code execution from the Start Address specified. Execution of this telecommand effectively passes control of the SES to the Application Software. TC (152,216) is only implemented by the SES Boot Software.

Refer to [RD.02] for details on TC(152,216).

6.19.1.56 TC (152,217) Set Tx Pulse Pre-distortion Parameters

TC(152,217) instruct the SES to set the Pre-distortion values that are common to all Tx Pulses.

Refer to [RD.02] for details on TC(152,217).

6.19.1.57 TM (152,218) Tx Pulse Predistortion Parameters Report

SES will generate TM(152,218) in response to a valid TC(152,183) request to report the Tx Pulse Predistortion Values.

Refer to [RD.02] for details on TM(152,218).

6.19.1.58 TC (152,219) Set User Defined RxM Test Pattern Data

TC(152,219) instruct the SES to set the user-defined Test Pattern Data used by the RxM's..

Refer to [RD.02] for details on TC(152,219).

6.19.1.59 TM (152,220) User Defined RxM Test Pattern Data Report

SES will generate TM(152,220) in response to a valid TC(152,225) request to report the user-defined RxM Test Pattern Data.

Refer to [RD.02] for details on TM(152,220).

6.19.1.60 TC (152,221) Set User Defined RxM Filter Parameters

TC(152,221) instruct the SES to set the user-defined Filter Parameters used by the RxM's..

Refer to [RD.02] for details on TC(152,221).

6.19.1.61 TM (152,222) User Defined RxM Filter Parameters Report

SES will generate TM(152,222) in response to a valid TC(152,225) request to report the user-defined RxM Filter Parameters data.

Refer to [RD.02] for details on TM(152,222).

6.19.1.62 TC (152,223) Set User Defined RxM Compression Parameters

TC(152,223) instruct the SES to set the user-defined Compression Parameters used by the RxM's..

Refer to [RD.02] for details on TC(152,223).

6.19.1.63 TM (152,224) User Defined RxM Compression Parameters Report

SES will generate TM(152,224) in response to a valid TC(152,225) request to report the user-defined RxM Filter Compression Parameters data.

Refer to [RD.02] for details on TM(152,224).

6.19.1.64 TC (152,225) Report User Defined RxM Configuration Data

TC(152,225) instruct the SES to generate a Telemetry packet, or packets, to report the values of the requested element of the user-defined RxM Configuration Data (i.e. the Test Pattern Data, Filter Parameters or Compression Parameters).

Refer to [RD.02] for details on TC(152,225).

6.19.1.65 TC (152,226) Save User Defined RxM Configuration Data

TC(152,226) instruct the SES to save the user-defined RxM Configuration Data (i.e. the Test Pattern Data, Filter Parameters and Compression Parameters) into EEPROM.

Refer to [RD.02] for details on TC(152,226).

6.19.1.66 TC (152,227) Set User Defined RxM Bit Rate Selection Parameters

TC(152,227) instruct the SES to set the user-defined Bit Rate Selection Parameters used by the RxM's. The values defined in the packet are written as a block to the appropriate memory area, starting at the position defined by the RxM Bit Rate Selection Index parameter.

Refer to [RD.02] for details on TC(152,227).

6.19.1.67 TM (152,228) User Defined RxM Bit Rate Selection Parameters Report

In response to TC(152,227), TM(152,228) reports the user-defined RxM Bit Rate Selection Parameter values. The values are read as a block from the memory area starting at the position given by the RxM Bit Rate Selection Index parameter.

Refer to [RD.02] for details on TM(152,228).

6.19.1.68 TC (152,229) Set User Defined RxM EC Parameters

TC(152,229) instruct the SES to set the user-defined EC Parameters used by the RxM's.

Refer to [RD.02] for details on TC(152,229).

6.19.1.69 TM (152,230) User Defined RxM EC Parameters Report

In response to TC(152,229), SES generates TM(152,230) to report the user defined RxM EC Parameters data.

Refer to [RD.02] for details on TM(152,230).

6.19.1.70 TC (152,231) Set User Defined RxM Index Values

TC(152,231) instruct the SES to set the user-defined RxM Index Values used by the RxM's.

Refer to [RD.02] for details on TC(152,231).

6.19.1.71 TM (152,232) User Defined RxM Index Values Report

In response to TC(152,231), SES generates TM(152,232) to report the user defined RxM Index Values.

Refer to [RD.02] for details on TM(152,232).

6.19.1.72 TC (152,233) Set User Defined RxM Range Zone Width Parameters

TC(152,233) instruct the SES to set the user-defined Range Zone Width Parameters used by the RxM's. The values defined in the packet are written to the appropriate memory area starting at the position defined by RxM Range Zone Width Index

Refer to [RD.02] for details on TC(152,233).

6.19.1.73 TM (152,234) User Defined RxM Range Zone Width Parameters Report

In response to TC(152,233), SES generates TM(152,234) to report the user defined RxM Range Zone Width Parameter data. The data in the packet is read as a block starting from the memory position given by RxM Range Zone Width Index.

Refer to [RD.02] for details on TM(152,234).

6.19.1.74 TC (152,235) Set User Defined RxM Filter Program Parameters

TC(152,235) instruct the SES to set the user-defined RxM Filter Program Parameters used by both RxMs. The Filter Program Entries defined in the packet are written as a block to the appropriate memory space starting at the position defined by RxM Filter Program Entry Index.

Refer to [RD.02] for details on TC(152,235).

6.19.1.75 TM (152,236) User Defined RxM Filter Program Parameters Report

In response to TC(152,235), SES generates TM(152,236) to report the user defined RxM Filter Program Parameters. The packet contains the block of Filter Program Entries starting from the position given by RxM Filter Program Entry Index.

Refer to [RD.02] for details on TM(152,236).

6.19.1.76 TC (152,237) Set User Defined RxM Filter Program Pointers

TC(152,237) instruct the SES to set the user-defined values for the RxM Filter Program Pointers for each of the RxM Filters.

Refer to [RD.02] for details on TC(152,237).

6.19.1.77 TM (152,238) User Defined RxM Filter Program Pointers Report

In response to TC(152,237), SES generates TM(152,238) to report the user defined values for the RxM Filter Program Pointers.

Refer to [RD.02] for details on TM(152,238).

6.19.1.78 TC (152,239) Set User Defined RxM Filter Control Registers

TC(152,239) instruct the SES to set the user-defined values for the RxM Filter Control Registers.

Refer to [RD.02] for details on TC(152,239).

6.19.1.79 TM (152,240) User Defined RxM Filter Control Registers Report

In response to TC(152,239), SES generates TM(152,240) to report the user defined values for the RxM Filter Control Registers.

Refer to [RD.02] for details on TM(152,240).

6.19.1.80 TC (152,241) Set TxM Power LUT Values

TC(152,241) instructs the SES to update the Transmit Module (TxM) with the Power Look-Up Table (LUT) values specified in the command.

Refer to [RD.02] for details on TC(152,241).

6.19.1.81 TC (152,242) Change Mode To Init

TC(152,242) instructs the SES to perform a transition to Init Mode, i.e. to change mode to Standby and then perform a Warm Reset of the ICM.

Refer to [RD.02] for details on TC(152,242).

6.19.1.82 TM (152,243) TxM Power LUT Values Report

In response to TC(152,183), SES generates TM(152,243) to report the Power Look-Up Values defined in the Radar Parameters Database.

Refer to [RD.02] for details on TM(152,243).

6.20 PDHT MISSION SPECIFIC SERVICES

6.20.1 Service 176: PDHT Mode Transitions

6.20.1.1 TC (176,1) INIT

TC(176,1) instructs to initialise the Application SW from the PATCH&DUMP mode.

Refer to [RD.06] for details on TC(176,1).

6.20.1.2 TC (176,2) IDLE

TC(176,2) commands a transition to IDLE mode.

Refer to [RD.06] for details on TC(176,2).

6.20.1.3 TC (176,3) STANDBY

TC(176,3) commands a transition to STANDBY Mode

Refer to [RD.06] for details on TC(176,3).

6.20.1.4 TC (176,4) MEM_ON

TC(176,4) commands a transition to MEM_ON Mode

Refer to [RD.06] for details on TC(176,4).

6.20.1.5 TC (176,5) TX_ON

TC(176,5) commands a transition to TX_ON Mode

Refer to [RD.06] for details on TC(176,5).

6.20.2 Service 177: PDHT Configuration

The PDHT Configuration Service is used to select PDHT redundancy configuration or to configure the active equipment during sub-system operations.

6.20.2.1 TC (177,1) Set TXA Configuration

TC(177,1) commands to configure the TXA.

Refer to [RD.06] for details on TC(177,1).

6.20.2.2 TC (177,2) Set TXA Redundancy

TC(177,2) defines the TXA redundancy configuration. The TXA units selected will be powered only during transition in TX-ON mode.

Refer to [RD.06] for details on TC(177,2).

6.20.2.3 TC (177,3) Set DSHA Redundancy

TC(177,3) defines the DSHA redundancy configuration. The DSHA units selected will be powered during opportune mode transitions.

Refer to [RD.06] for details on TC(177,3).

6.20.2.4 TC (177,4) Configure Memory Module

TC(177,4) instructs to substitute a failed Memory Module with the spare module.

Refer to [RD.06] for details on TC(177,4).

6.20.2.5 TC (177,5) Set Override Carrier

TC(177,5) allows to enable/disable the override Carrier OFF circuit in order to avoid the generation of an unmodulated carrier when there is no valid data to be transmitted..

Refer to [RD.06] for details on TC(177,5).

6.20.3 Service 178: PDHT Function Management

6.20.3.1 TC (178,225) Enable Switch Down

TC(178,225) is used to re-start recovery action activation.

Refer to [RD.06] for details on TC(178,225).

6.20.3.2 TC (178,226) Inhibit Switch Down

TC(178,226) is used to support ground testing and useful for in orbit diagnostic. TC(178,226) allows to disable all the recovery actions (e.g. transition to SAFE if any check performed during the MEM-ON to TX-ON transition fails or any monitoring check fails) which the on-board software starts after an anomaly detection. In this way monitoring is fully operating and any anomaly is logged with an Event Report but no recovery action is activated.

Refer to [RD.06] for details on TC(178,226).

6.20.3.3 TC (178,229) Enable/Disable Timeouts

TC(178,229) allows to enable/disable the SAR data interface timeout (at the start and during data acquisition).

Refer to [RD.06] for details on TC(178,229).

6.20.3.4 TC (178,230) Reboot

TC(178,230) allows to reproduce a PDHT switch on transition to IDLE without using the discrete ON and OFF command interface when in IDLE mode.

Note: A DSHA executed recovery action as a result of detectable errors can automatically drive the PDHT in IDLE mode.

Refer to [RD.06] for details on TC(178,230).

6.20.3.5 TC (178,231) Direct Command

TC(178,231) allows to generate a Direct Command which directly acts on the DHSA TM/TC board forcing the generation of a discrete command.

TC(178,231) will only be used during on-ground PDHT integration activities.

Refer to [RD.06] for details on TC(178,231).

6.20.3.6 TC (178,232) Enable/Disable Column Switch

TC(178,232) allows directly to enable or disable column switch on a single memory module.

Refer to [RD.06] for details on TC(178,232).

6.21 LCT MISSION SPECIFIC SERVICES

6.21.1 Service 240: Parameter Management Service

6.21.1.1 TC (240,1) Set N Parameters

TC(240,1) instructs to set the values of the N parameters to the specified value.

Refer to [RD.09] for details on TC(240,1).

6.21.1.2 TC (240,2) Get N Parameters

TC(240,2) requests to report the value of the specified parameters.

Refer to [RD.09] for details on TC(240,2).

6.21.1.3 TM (240,3) Parameter Report

TM(240,3) is in response to TC(240,2)

Refer to [RD.09] for details on TM(240,3).

6.21.1.4 TC (240,4) Reload Default Parameter

TC(240,4) instructs to overwrite all the RAM parameters to the default values stored in EEPROM (i.e. copy the parameters from EEPROM to RAM overwriting any modifications performed before).

Refer to [RD.09] for details on TC(240,4).

6.21.1.5 TC (240,5) Update Default Parameter

TC(240,5) instructs to store the RAM parameters in EEPROM to become the new default values (i.e. the EEPROM values are over written with the RAM values).

Refer to [RD.09] for details on TC(240,5).

6.21.1.6 TC (240,24) Reload N Default Parameters

TC(240,24) instructs to overwrite N RAM parameters with the default values stored in EEPROM (i.e. copy N parameters from EEPROM to RAM overwriting any modifications performed before).

Refer to [RD.09] for details on TC(240,24).

6.21.1.7 TC (240,25) Update N Default Parameters

TC(240,25) instructs to store the addressed N RAM parameters in EEPROM to become the new default values (i.e. the N EEPROM values are overwritten with the RAM values).

Refer to [RD.09] for details on TC(240,25).

6.21.2 Service 241: LCT Mode Transitions

6.21.2.1 TC (241,136) LCT Goto Application SW Boot Mode

TC(241,136) commands a mode transition to Application SW Boot Mode.

Refer to [RD.09] for details on TC(241,136).

6.21.2.2 TC (241,139) LCT Goto Selftest Mode

TC(241,139) commands a mode transition to Selftest Mode.

Refer to [RD.09] for details on TC(241,139).

6.21.2.3 TC (241,140) LCT Goto Commanded Functional Test Mode

TC(241,140) commands a mode transition to Commanded Functional Test Mode.

Refer to [RD.09] for details on TC(241,140).

6.21.2.4 TC (241,142) LCT Perform Warm Restart

TC(241,142) commands the LCT to perform a Warm Restart.

Refer to [RD.09] for details on TC(241,142).

6.21.2.5 TC (241,143) Get LCT Self Test Report

TC(241,143) requests to generate the LCT Self Test report (i.e. TM(241,144)).

Refer to [RD.09] for details on TC(241,143).

6.21.2.6 TM (241,144) LCT Self Test Report

TM(241,144) is generated in response to TC(241,143).

Refer to [RD.09] for details on TM(241,144).

6.21.2.7 TC (241,145) LCT Goto Terminal Warmup Mode

TC(241,145) commands a mode transition to Terminal Warmup Mode.

Refer to [RD.09] for details on TC(241,145).

6.21.2.8 TC (241,146) LCT Goto SW Standby Mode

TC(241,146) commands a mode transition to SW Standby Mode.

Refer to [RD.09] for details on TC(241,146).

6.21.2.9 TC (241,147) LCT Goto Terminal Ready Mode

TC(241,147) commands a mode transition to Terminal Ready Mode.

Refer to [RD.09] for details on TC(241,147).

6.21.2.10 TC (241,148) LCT Goto Terminal Standby Mode

TC(241,148) commands a mode transition to Terminal Standby Mode.

Refer to [RD.09] for details on TC(241,148).

6.21.2.11 TC (241,149) LCT Goto Calibration Mode

TC(241,149) commands a mode transition to Calibration Mode.

Refer to [RD.09] for details on TC(241,149).

6.21.2.12 TC (241,150) LCT Goto Operation Mode

TC(241,150) commands a mode transition to Operation Mode.

Refer to [RD.09] for details on TC(241,150).

6.21.2.13 TC (241,152) LCT Goto Safe Mode

TC(241,152) commands a mode transition to Safe Mode.

Refer to [RD.09] for details on TC(241,152).

6.21.2.14 TC (241,153) Report LCT TAPCO SW Status

TC(241,153) requests to generate an LCT TAPCO SW status report (i.e TM(241,154)).

Refer to [RD.09] for details on TC(241,153).

6.21.2.15 TM (241,154) LCT TAPCO SW Status Report

TM(241,154) is in response to TC(241,153).

Refer to [RD.09] for details on TM(241,154).

6.21.2.16 TC (241,155) LCT Goto Launch Lock Release Mode

TC(241,155) commands a mode transition to Launch Lock Release Mode.

Refer to [RD.09] for details on TC(241,155).

6.21.2.17 TC (241,156) LCT Goto Emergency Safe

TC(241,156) instructs to restore the LCT to the Emergency Safe which allows subsequently an emergency shutdown of the LCT when the discrete telecommand signal "LCT OFF" is applied to the DC/DC Converter of the LCT.

When TC (241,156) is received, the TAPCO activates a fast transition to the Safe Mode. The change to the Safe Mode is executed regardless of which Mode the TAPCO is actual running except for the Firmware Boot Mode, the Safe Parking Mode and the Safe Mode itself.

Refer to [RD.09] for details on TC(241,156).

6.21.2.18 TC (241,157) Get LCT Self Calibration Report

TC(241,157) instructs to generate the report TM(241,158).

Refer to [RD.09] for details on TC(241,157).

6.21.2.19 TM (241,158) LCT Self Calibration Report

TM(241,158) is in response to TC(241,157).

Refer to [RD.09] for details on TM(241,158).

6.21.2.20 TC (241,159) LCT Goto Application SW Boot Mode from Address

TC(241,159) instructs the TAPCO to read the start address of the OAS start function from the OAS Header and then execute the function from this address.

Note: The received parameter value must be the OAS RAM Address of a valid OAS RAM Image. The OAS RAM Image starts with an OAS Header which contains the following parameters:

- OAS Magic Word,
- OAS Release Date,
- OAS Coded Version, and
- OAS Start Address.

Refer to [RD.09] for details on TC(241,159).

6.21.3 Service 242: LCT Configuration Service

6.21.3.1 TC (242,2) Get Terminal Configuration

TC(242,2) requests a report of the status of the Terminal Configuration to which it responds with TM(242,3).

Refer to [RD.09] for details on TC(242,2).

6.21.3.2 TM (242,3) Terminal Configuration Report

TM(242,3) is in response to TC(242,2).

Refer to [RD.09] for details on TM(242,3).

6.21.3.3 TC (242,4) Perform Measurement (No Parameter Change)

TC(242,4) instructs the TAPCO to perform measurements of the specified parameters to be logged in a dedicated area of the TAPCO RAM for monitoring and diagnostic purposes. After completion of the measurement the contents of the TAPCO RAM can be dumped to Ground by TM (6,6).

Refer to [RD.09] for details on TC(242,4).

6.21.3.4 TC (242,5) Select 1PPS Synchronisation Signal A

TC(242,5) instructs to select the input of the 1PPS Synchronization Signal A. When TC (242,5) is received, the TAPCO enable the 1PPS Synchronization Signal A receiver.

Refer to [RD.09] for details on TC(242,5).

6.21.3.5 TC (242,6) Select 1PPS Synchronisation Signal B

TC(242,6) instructs to select the input of the 1PPS Synchronization Signal B. When TC (242,6) is received, the TAPCO enable the 1PPS Synchronization Signal B receiver.

Refer to [RD.09] for details on TC(242,6).

6.21.3.6 TC (242,7) Set Pump Module Head TX Laser Bench Configuration

TC(242,7) specifies the parameter value to be used to set the Pump Module Head TX (PMH-TX) Laser Bench configuration.

Refer to [RD.09] for details on TC(242,7).

6.21.3.7 TC (242,8) Set Pump Module Head LO Laser Bench Configuration

TC(242,8) specifies the parameter value to be used to set the Pump Module Head LO (PMH-LO) Laser Bench configuration.

Refer to [RD.09] for details on TC(242,8).

6.21.3.8 TC (242,9) Set Optical Power 1 Laser Diode Configuration

TC(242,9) specifies the parameter value to be used to set the Optical Power Amplifier 1 (OPA 1) Laser Diode configuration.

Refer to [RD.09] for details on TC(242,9).

6.21.3.9 TC (242,10) Set Optical Power 2 Laser Diode Configuration

TC(242,10) specifies the parameter value to be used to set the Optical Power Amplifier 2 (OPA 2) Laser Diode configuration.

Refer to [RD.09] for details on TC(242,10).

6.21.3.10 TC (242,11) Set Optical Power 3 Laser Diode Configuration

TC(242,11) specifies the parameter value to be used to set the Optical Power Amplifier 3 (OPA 3) Laser Diode configuration.

Refer to [RD.09] for details on TC(242,11).

6.21.3.11 TC (242,12) Set Data Transmission Configuration

TC(242,12) instructs to set the Data Transmission configuration using the specified parameter value,

Refer to [RD.09] for details on TC(242,12).

6.21.3.12 TC (242,13) Set CPA Encoder Azimuth Configuration

TC(242,13) instructs to set the CPA Encoder Azimuth configuration using the specified parameter value,

Refer to [RD.09] for details on TC(242,13).

6.21.3.13 TC (242,14) Set CPA Encoder Elevation Configuration

TC(242,14) instructs to set the CPA Encoder Elevation configuration using the specified parameter value,

Refer to [RD.09] for details on TC(242,14).

6.21.3.14 TC (242,128) Copy Terminal Configuration from RAM to EEPROM

C(242,128) instructs to store the Terminal Configuration values located in RAM into the EEPROM to become the new default values.

Refer to [RD.09] for details on TC(242,128).

6.21.3.15 TC (242,129) Copy Terminal Configuration from EEPROM to RAM

TC(242,129) instructs to copy the Terminal Configuration values located in EEPROM into the RAM.

Refer to [RD.09] for details on TC(242,129).

6.21.4 Service 244: LCT Table Management Service

6.21.4.1 TC (244,1) Set Table Row

TC(244,1) is used to write a new content to a specified row of a dedicated table located in the TAPCO RAM.

Refer to [RD.09] for details on TC(244,1).

6.21.4.2 TC (244,2) Get Table Row

TC(244,2) request to report the content of a specified row of a dedicated table located in the TAPCO RAM to which it responds with TM(244,3).

Refer to [RD.09] for details on TC(244,2).

6.21.4.3 TM (244,3) Table Row Report

TM(244,3) is generated in response to TC(244,2).

Refer to [RD.09] for details on TM(244,3).

6.21.4.4 TC (244,4) Reload Default Table from EEPROM

TC(244,4) instructs to copy the default content of a specified table from TAPCO EEPROM to the TAPCO RAM, overwriting any potential changes performed before with TC(244,1).

Refer to [RD.09] for details on TC(244,4).

6.21.4.5 TC (244,5) Update Default Table to EEPROM

TC(244,5) instructs to copy the content of a specified table from TAPCO RAM as new default to the TAPCO EEPROM.

Refer to [RD.09] for details on TC(244,5).

6.21.5 Service 245: LCT Commanded Functional Test Mode Service

6.21.5.1 TC (245,2) Switch LCT Internal Unit Power On/Off

TC(245,2) commands to switch “On” or “Off” the specified internal LCT units (DC/DC Converter) identified by the Units ID value. The LCT units are:

- DC/DC Converter 2
- DC/DC Converter 3

Refer to [RD.09] for details on TC(245,2).

6.21.5.2 TC (245,3) Switch RXDE / TXDE Functions On/Off

TC(245,3) allows to “Select” the functions of the RXDE Channel Rotator or the TXDE Reference Frequencies Selection identified by the Function ID.

Refer to [RD.09] for details on TC(245,3).

6.21.5.3 TC (245,4) Set RXDE Channel Rotator

TC(245,4) allows to control the RXDE Channel Rotator manually.

Refer to [RD.09] for details on TC(245,4).

6.21.5.4 TC (245,5) Reset TXDE / RXDE Functions

TC(245,5) allows to reset the:

- RXDE Service Channel Word Decoding Error
- TXDE FIFO Overflow Flag
- RXDE FIFO Overflow Flag

According to the specified Function ID:

Refer to [RD.09] for details on TC(245,5).

6.21.5.5 TC (245,7) Set Optical Power Amplifier (OPA) Parameter Set

TC(245,7) instructs to set the Optical Power Amplifier (OPA) parameters to the values specified in the telecommand.

Refer to [RD.09] for details on TC(245,7).

6.21.5.6 TC (245,8) Set Fine Pointing Assembly (FPA) Parameter Set

TC(245,8) instructs to set the Fine Pointing Assembly (FPA) parameters to the values specified in the telecommand.

Refer to [RD.09] for details on TC(245,8).

6.21.5.7 TC (245,9) Set Point Ahead Assembly (PAA) Parameter Set

TC(245,9) instructs to set the Point Ahead Assembly (PAA) parameters to the values specified in the telecommand

Refer to [RD.09] for details on TC(245,9).

6.21.5.8 TC (245,10) Set Coarse Pointing Assembly (CPA) Parameter Set

TC(245,10) instructs to set the Coarsr Pointing Assembly (CPA) parameters to the values specified in the telecommand

Refer to [RD.09] for details on TC(245,10).

6.21.5.9 TC (245,11) Activate / Deactivate Loops

TC(245,11) allows to control the activation and disactivation of a number of control loops.

Refer to [RD.09] for details on TC(245,11).

6.21.5.10 TC (245,12) Start Self Calibration

TC(245,12) commands to start the "Self Calibration" mode.

Refer to [RD.09] for details on TC(245,12).

6.21.5.11 TC (245,13) Start Operation

TC(245,13) commands to start the "Acquisition" mode

Refer to [RD.09] for details on TC(245,13).

6.21.5.12 TC (245,14) Continue Acquisition

TC(245,14) instructs to continue the acquisition.

Refer to [RD.09] for details on TC(245,14).

6.21.5.13 TC (245,15) Start Tracking with PAA

TC(245,15) commands to start the "Tracking with PAA".

Refer to [RD.09] for details on TC(245,15).

6.21.5.14 TC (245,16) Perform Measurement (Sweep, Scan)

TC(245,16) commands to execute the specified measurement.

Refer to [RD.09] for details on TC(245,16).

6.21.5.15 TC (245,17) Enable / Disable PAT Mechanisms

TC(245,17) commands the enable or disable the mechanisms according to the specified Mechanism ID of:

- Coarse Pointing Assembly (CPA) Azimuth Motor
- Coarse Pointing Assembly (CPA) Elevation Motor
- All Fine Pointing Assembly (FPA) Motors
- All Point Ahead Assembly (PAA) Motors

Refer to [RD.09] for details on TC(245,17).

6.21.5.16 TC (245,18) Stop All Running PAT Algorithms

TC(245,18) commands to stop all running PAT Algorithms.

Refer to [RD.09] for details on TC(245,18).

6.21.5.17 TC (245,19) Reset LCT Measurement Results Memory

TC(245,19) instructs to clear (reset) the LCT Measurement Results Memory.

Refer to [RD.09] for details on TC(245,19).

6.21.5.18 TC (245,21) Switch LCT Internal Heater Power On / Off

TC(245,21) commands the switch "On" or "Off" of the internal LCT heaters specified by Heater ID value.

Refer to [RD.09] for details on TC(245,21).

6.21.5.19 TC (245,25) Start RXA Diagnostic Data Measurement

TC(245,25) commands to start the RXA Diagnostic Data Measurements.

Refer to [RD.09] for details on TC(245,25).

6.21.5.20 TC (245,26) Get RXA Diagnostic Data Report

TC(245,26) requests to generate the report of the RXA Diagnostic Data Measurement.(i.e. TM(245,27)).

Refer to [RD.09] for details on TC(245,26).

6.21.5.21 TM (245,27) RXA Diagnostic Data Report

TM(245,27) is generated in response to TC(245,26).

Refer to [RD.09] for details on TM(245,27).

6.21.5.22 TC (245,32) Start Automatic Heater Powering

TC(245,32) commands to start the automatic heater powering of the H-FUS3 heater.

Refer to [RD.09] for details on TC(245,32).

6.21.5.23 TC (245,33) Stop Automatic Heater Powering

TC(245,33) commands to stop the automatic heater powering of the H-FUS3 heater (i.e. the heater power status of the H-FUS3 heater is set to "Off").

Refer to [RD.09] for details on TC(245,33).

6.21.5.24 TC (245,34) Set ASK-EOM Parameter

TC(245,34) instructs to set the ASK EOM parameters to the specified values.

Refer to [RD.09] for details on TC(245,34).

6.21.5.25 TC (245,35) Switch OPLL Integrator On / Off

TC(245,35) commands to switch “On” or “Off” the OPLL Integrator.

Refer to [RD.09] for details on TC(245,35).

6.21.5.26 TC (245,36) Set PMH-TX Heater Control Temperature Parameter

TC(245,36) instructs the setting of the PMH-TX Heater with the specified parameter values.

Refer to [RD.09] for details on TC(245,36).

6.21.5.27 TC (245,37) Set PMH-LO Heater Control Temperature Parameter

TC(245,37) instructs the setting of the PMH-LO Heater with the specified parameter values.

Refer to [RD.09] for details on TC(245,37).

6.21.5.28 TC (245,38) Set CC-A Heater Control Temperature Parameter

TC(245,38) instructs the setting of the CC-A Heater with the specified parameter values.

Refer to [RD.09] for details on TC(245,38).

6.21.5.29 TC (245,39) Set CC-B Heater Control Temperature Parameter

TC(245,39) instructs the setting of the CC-B Heater with the specified parameter values

Refer to [RD.09] for details on TC(245,39).

6.21.5.30 TC (245,42) Set LO Laser Parameter Set

TC(245,42) instructs the settings of the Local Oscillator (LO) Laser parameters with the specified parameter values.

Refer to [RD.09] for details on TC(245,42).

6.21.5.31 TC (245,43) Set TX Laser Parameter Set

TC(245,43) instructs the settings of both the Transmitter (TX) Laser parameters with the specified parameter values.

Refer to [RD.09] for details on TC(245,43).

6.21.6 Service 246: LCT Target Trajectory Management Service

6.21.6.1 TC (246,10) Report LCT Target Trajectory Parameter

TC(246,10) instructs the TAPCO to report the set of LCT Target Trajectory Parameters. The TAPCO responds with TM(246,11).

Refer to [RD.09] for details on TC(246,10).

6.21.6.2 TM (246,11) LCT Target Trajectory Parameter Report

TM(246,11) is in response to TC(246,10).

Refer to [RD.09] for details on TM(246,11).

6.21.6.3 TC (246,12) Set LCT Target Trajectory Parameter

Upon reception of TC(246,12) the TAPCO updates the target trajectory parameters with the values contained in the TC.

Refer to [RD.09] for details on TC(246,12).

6.21.7 Service 247: LCT Launch Lock Release Mode Service

The LCT Launch Lock Release Mode Service provides the capability to perform either a manual or automatic control of the Launch Lock Release sequence of both

- Coarse Pointing Assembly (CPA) / Park Position Assembly (PPA) configuration, and
- Bearing Active Preload System (BAPS).

6.21.7.1 TC (247,1) Switch On Nominal CPA Launch Lock Heater Power

TC(247,1) commands the switch On of the nominal CPA Launch Lock Heater power.

Refer to [RD.09] for details on TC(247,1).

6.21.7.2 TC (247,2) Switch On Nominal BAPS Az & El Heater Powers

TC(247,2) commands the switch On of the nominal BAPS Az & El Heater power.

Refer to [RD.09] for details on TC(247,2).

6.21.7.3 TC (247,3) Perform CPA Az & El Current Measurement

TC(247,3) instructs the TAPCO to perform the following simplified operating sequence:

- Move the CPA in the predefined azimuth and elevation directions,
- Measure and log the CPA Azimuth current values and CPA Elevation current values in the TAPCO RAM during the CPA movements.
- Calculate the mean values of the logged CPA Az & El current values after completion of the CPA movements.
- Determine the peak values of the logged CPA Az & El current values after completion of the CPA movements.
- Report both the CPA Az & El mean current values and the CPA Az & El peak current values to the Ground by the TM(247,5) CPA Az & El Current Measurement Report.

Refer to [RD.09] for details on TC(247,3).

6.21.7.4 TC (247,4) Start Automatic Launch Lock Release Operating Sequence

TC(247,4) instructs the TAPCO to perform the simplified operating sequence: for the automatic Launch Lock Release.

Refer to [RD.09] for details on TC(247,4).

6.21.7.5 TM (247,5) CPA Az & EI Current Measurement Report

TM(247,5) is generated in response to TC(247,3).

Refer to [RD.09] for details on TM(247,5).

7 MISSION CONSTANTS

CONSTANT IDENTIFIER	DEFINITION	RANGE OR VALUE
CPDU_DURATION_UNIT	Specifies the pulse duration unit defined for the CPDU, which can be any value between 10 ms and 15 ms. The actual pulse duration for a given CPDU instruction is expressed as a multiple of this value.	D = 15 ms
CPDU_MAX_INSTR	Represents the maximum number of command pulse instructions that can be contained within a CPDU telecommand packet (at least 12 and at most 109).	TC CPDU max pulse instructions is 109 and total execution time must not exceed 16 s.
HDP_MIN_INTERVAL	Represents the minimum sampling interval for the on-board sampling of parameters in housekeeping, diagnostic, or physical reports.	AVS = 125 ms
MISSION_TIME_CODE	Defines the value of the P-field for the time report packet, where this is not contained explicitly within the "Satellite Time" field of that packet.	
MONLIST_MAX_CHECKS	Represent the maximum number of limit pairs or expected values which can be specified for the on-board monitoring of a parameter.	For DSHA = 4
MONLIST_MAX_PARAMS	Represent the maximum number of parameters which can be monitored at any given time by an On-board Monitoring Service (PUS #12).	
PARAM_ABS_SAMPL_TIME	Represent the accuracy to which the absolute (on-board) sampling time of a telemetry parameter can be determined.	
PARAM_REL_SAMPL_TIME	Represent the accuracy to which the relative	

CONSTANT IDENTIFIER	DEFINITION	RANGE OR VALUE
	sampling time of any two parameters, which can be telemetered in different packets, can be determined.	
PKT_STORAGE_TIME	Represent the time for which telemetry source packets must be stored on-board, for later dumping to ground, over and above the longest time interval without ground coverage.	
PSLIST_MAX_PARAMS	Represents the maximum number of parameters whose statistical values can be evaluated at any given time by the application process Parameter Statistics Reporting Service (PUS #4).	
SMALLEST_ADDRESSABLE_UNIT	Represents the smallest unit that the on-board processor can address. This constant is used by the Memory Management Service (PUS #6) for addressing purposes.	
TCPKT_MAX_LENGTH	Represents the maximum length of a telecommand packet.	256 16-bit words.
TC_CHECKSUM_TYPE	Represent the type of checksum used for checking the integrity of telecommand packets by the Telecommand Verification Service (PUS #1).	Cyclic Redundancy Code compliant to PUS Annex A1.
TMPKT_MAX_LENGTH	Represents the maximum length of a telemetry source packet.	128 16-bit words
TM_CHECKSUM_TYPE	This constant shall represent the type of checksum to be computed for the telemetry source packets.	Cyclic Redundancy Code compliant to PUS Annex A1.

8 COMMON DATA TABLES

8.1 APPLICATION PROCESS ID

The Application Process ID (APID) is divided into Process ID (PID - first 7 bits) and Packet Category (PCAT - last 4 bits).

The PID forms a base address which identifies the process to which the TC packet is addressed or generating the TM packet.

The PCAT identifies different categories of TM packets which Ground typically processes in different ways and for which separate accounting (i.e. source sequence counts) is required to be kept.

The PCAT for TC are not used and set to a fixed value.

Telemetry packets originating from a spacecraft application/instrument/unit are assigned the same PID as used for the telecommands to that application/instrument/unit. This implies that the first 7 bits of the telecommand APID are the same to the ones used for the TM packet.

8.1.1 Process ID

Table 8.1.1 reports the assignment of Process ID codes to onboard AVS, C-SAR instrument, PDHT S/S and Ground EGSE.

PID DEC	PID HEX	NUMBER OF PID	SUBSYSTEM / EQUIPMENT / SW	UNIT / FUNCTION	REMARK

Table 8.1.1-1 : Process ID Assignment

8.1.2 Packet Category

Packet Category (PCAT), a 4-bit field, identifies different categories of TM packets which Ground typically processes in different ways and for which separate accounting (i.e. source sequence counts) is required to be kept.

The on-board design must guarantee reception on-ground of TM packets with a continuous source sequence count which allows Ground to immediately detect missing TM packet(s).

THALES

Table 8.1.2-2 : TM Packet Category

8.2 TC SOURCE ID AND TM DESTINATION ID FIELDS

A Packet Terminal executes not only immediate telecommands directly received from Ground, but also telecommands which are generated onboard. The onboard generated telecommands are also PUS telecommands like those sent from Ground. Thus these onboard telecommands are accepted and executed in the same way as telecommands received from Ground.

Consequently for each TC, regardless of its origin, the acceptance and/or execution is reported to Ground by Service 1 TM packets. Hence it is possible that Ground receives a number of Service 1 reports, even though it has only sent a single TC shortly before.

To enable to discriminate Service 1 TM packets a concept which makes use of the "Source ID" and "Destination ID" of the packet data header fields of the TC and TM packets respectively will be used. The concept has already been used in Mars Express and refined by ASD for TerraSAR-X and now adapted by ASD and TASI for Sentinel-1. The concept is described below.

Telecommands generated onboard include time-tagged telecommands released from the **Service 11** Onboard Time-Tag Command Schedule, position-tagged telecommands released from **Service 132** Onboard Position-Tag Command Schedule, action telecommands released from the **Service 19** Detection List, telecommands released from the **Service 18** OBCP, the armed telecommand released from the **Service 133** Two-Step Telecommand, hard-coded commands released from the **Service 8** Function Management or commands released from the AVS On-Board Command Data Base.

All onboard commands are either loaded by nested telecommands or are hard coded in EEPROM before the mission.

Concept Description

TM reports are divided into the classes of "solicited" and "unsolicited".

"Solicited" are all TM packets, which are generated in response to a TC. This comprises first the Service 1 reports and eventually other TM packets like memory dumps, list & status reports, etc.

"Unsolicited" TM packets are further divided into "periodic TM" (i.e. HK and Diagnostic Reports) and "spontaneous TM" (i.e. Event Reports).

For solicited TM, the onboard application shall insert a copy of the TC packet's "Source ID" into the TM packet's "Destination ID". For unsolicited TM it shall set the "Destination ID" to a fixed value.

The ECSS-PUS standard does not forbid assigning multiple codes for "Ground" to the enumerated "Destination ID". Hence the applied conventions for "Source ID" and "Destination ID" are reported in Table 8.2-1 and Table 8.2-2 respectively.

With the assigned coding the "Source ID" within the TC indicates whether the TC is directly sent from Ground, comes out of either the Onboard Time-Tag Command Schedule, the Onboard Position-Tag Command Schedule, the AVS OBC Data Base, the Onboard Control Procedure (OBCP), the Service 19 (Event/Action) Detection List or is generated by a specific onboard function.

As all codes of the "Destination ID" in Table 8.2-2 have the meaning "Ground", there is no need to maintain separate Source Sequence Counters, which is required by the PUS standard in case of different destinations.

SOURCE ID CODE	SOURCE
0	RESERVED
1	GROUND

SOURCE ID CODE	SOURCE
2	SERVICE 8 (Used by C-SAR)
3	ON-BOARD COMMAND DATA BASE (Used by AVS)
4	SERVICE 11 (Time Tag Command Schedule)
5	SERVICE 132 (Position Tag Command Schedule)
6	SERVICE 18 (OBCP)
7	SERVICE 19 (Action)
8	SERVICE 133 (Two-Step Command)

Table 8.2-1 : Source ID Assignment

DESTINATION ID CODE	DESTINATION
0	GROUND – Unsolicited TM
1	GROUND – TM in response to a direct TC from Ground
2	GROUND – TM in response to a TC generated onboard by a Service 8 hard coded function (Used by C-SAR)
3	GROUND – TM in response to a TC in the On-Board Command Data Base (Used by AVS)
4	GROUND – TM in response to a TC released from the Service 11 Time Tag Command Schedule.
5	GROUND – TM in response to a TC released from the Service 132 Position Tag Command Schedule.
6	GROUND - TM in response to a TC released from the Service 18 OBCP.
7	GROUND - TM in response to a TC released from the Service 19 action.
8	GROUND - TM in response to a TC released from the Service 133 Two-Step Command.

Table 8.2-2 : Destination ID Assignment

The Source ID is controlled in the following way:

Except for hard coded commands generated by Service 8 and those from the AVS OBC Data Base the allocation of Source IDs are not hard-coded in the onboard software, but the Source ID is set by Ground when it creates the embedded TC to be loaded with TC (11,4), TC (132,4), TC (18,1) or specific OBCP service subtype, TC (130,1) for AVS OBC Data Base or to the Detection List. The same applies to the acknowledgement flags. The acknowledgement flags of the embedded TC determine whether positive acknowledgment is performed for the TC when it is eventually released.

It must be possible to modify the acknowledgement flags for hard-coded TC. Two global Boolean variables must be defined for that purpose, which can be updated by Ground. Their value determine whether the acceptance and/or completion acknowledgement are to be generated or not.

8.3 PARAMETER NUMBER

8.3.1 Parameter Number Range Assignment

Table 8.3-1 reports the assignment of Parameter Number code ranges to onboard AVS, C-SAR instrument, and PDHT S/S.

SUBSYSTEM	PARAMETER NUMBER RANGE
AVS	00000000 - 5FFFFFFF
LCT	60000000 – 6FFFFFFF
C-SAR SES	80000000 - A1FFFFFF
C-SAR SAS	A2000000 - BFFFFFFF
PDHT	C0000000 - C6FFFFFF
Reserved	70000000 – 7FFFFFFF C7000000 - FFFFFFFF

Table 8.3-1 : Parameter Number Assignment

8.3.2 AVS Parameter Number Structure

The Avionics Software (ASW) Parameter Number assignments follow the structure shown in Figure 8.3.2-1 where the first 16-bit identify the Data Pool and the following 16-bit identify the parameter in the Data Pool. The Data Pool is a collection of parameter identifiers.

The parameter identifier FFFF conventionally indicates the whole Data Pool. Whereas the parameter 0000 conventionally indicates the NULL TAG.

Figure 8.3.2-1: AVS Parameter Number Structure

The ASW has the following range assignments for the Data Pool identifiers.

NM ASW + NM Specific Hardware :

0000 – 001F	NM ACTXT
0020 – 003F	spare
0040 – 005F	NM SSMNG
0060 – 007F	spare
0080 – 00BF	NM SSMA
00C0 – 00DF	spare
00E0 – 00FF	NM AOC&N

NM/SM ASW + NM/SM Common Hardware:

00100 – 002FF

SM ASW:

003FF – 0043F (Application level)
00440 – 004FF (SM SSMNG)

8.3.3 C-SAR SES Parameter Number Structure

The SES Parameter Number assignments follow the structure shown in Figure 8.3.3-1.

The most significant bit of the Parameter number is a fixed value and set to '1' to allow the SES parameter numbers to remain in the assigned range of section 8.3.1. The Group Number is used to describe a logical group of parameters that have some commonality e.g. they are all components of a packet header. The Subgroup Number is a unique number to identify a specific parameter within a Group.

SES defined Group Numbers are:

- 0 ⇒ TM or TC Packet Parameters
- 1 ⇒ TM or TC Data Parameters
- 2 ⇒ SW Parameters
- 3 ⇒ Mission Constants
- 4..15 ⇒ Not Used.

Refer to [RD.02] Appendix A for the SES parameter list.

Figure 8.3.3-1: SES Parameter Number Structure

8.3.4 C-SAR SAS Parameter Number Structure

The SAS TCU Parameter Number assignments follow the structure shown in Figure 8.3.4-1.

The first most significant 12-bits are fixed and set to A20 Hex to remain in the assigned range of section 8.3.1. The TCU ID identify the TCU and have values 1 to E for TCU-1 to TCU-14 respectively. The Parameter Count identify the parameter and are assigned unique values in the range 0001 to 00xx.

Refer to [RD.03] for the TCU parameter list.

Figure 8.3.4-1: SAS Parameter Number Structure

8.3.5 LCT Parameter Number Structure

The LCT Parameter Number assignments follow the structure shown in Figure 8.3.5-1.

Figure 8.3.5-1: LCT Parameter Number Structure

Where:

Process ID = 6E hex (110 dec)

Hence the LCT Parameter Number is within the range 6E000000 – 6E00FFFF.

8.4 MISSION SPECIFIC SERVICE TYPE/SUBTYPE NUMBERING

Table 8.3-1 reports the assignment of mission specific service type/subtype numbers to AVS SW (ASW), C-SAR instrument, PDHT and GPS.

SERVICE TYPES	SPECIFIC SERVICE SUBTYPE NUMBERS						
	COMMON	ASW	C-SAR	PDHT	GPS	LCT	SPARE
Service Type 1	128..143	144..159	160..175	224..239		240..255	176..223
Service Type 2	128..143	144..159	160..175	224..239			176..223 240..255
Service Type 3	128..143	144..159	160..175	224..239		240..255	176..223
Service Type 4	128..143	144..159	160..175	224..239			176..223 240..255
Service Type 5	128..143	144..159	160..175	224..239	210..219	240..255	176..209 220..223
Service Type 6	128..143	144..159	160..191	224..239	210..219	240..255	192..209 220..223
Service Type 8		128..159	160..175	224..239			176..223 240..255

LCT Specific Service Types 240..255						0..255	

Table 8.4-1 : Mission Specific Service Type/Subtype Number Assignment

8.5 REPORT IDENTIFICATION

Figure 8.5-1 defines the structure of the RID format to achieve unique RID definitions.

Figure 8.5-1 : Report ID Structure

RID FIELD	DESCRIPTION	RANGE OR VALUE
RID CAT	Report ID category	0 = Common RID 1 = ASW Specific RID & GPSR Specific RID 1000 H to 12FF H: ASW 1300 H to 17FF H: GPSR 1800 H to 1FFF H: ASW 2 = C-SAR SES Specific RID 3 = C-SAR SAS Specific RID 4 = PDHT Specific RID 6 = LCT Specific RID 9 = ESOC 5, 6, 7, 8, 10..15 = Spare
RID CODE	Report ID code	0 to $2^{12} - 1$

8.6 STRUCTURE IDENTIFICATION

Figure 8.6-1 defines the structure of the SID format to achieve unique SID definitions.

Figure 8.6-1 : SID Structure

SID FIELD	DESCRIPTION	RANGE OR VALUE
SID CAT	SID Category	0 = Reserved 1 = ASW SID 2 = C-SAR SES SID 3 = C-SAR SAS SID 4 = PDHT SID 6 = LCT SID 13 & 14 = GPS SID – (*) 9 = ESOC 5, 7, 8, 10..12, 15 = Spare
SID CODE	SID code	0 to $2^{12} - 1$

Note: (*) – The least significant byte of the S1 GPSR SID is fixed to zero. The SID values reported in Table 5-41 of Sentinel GPSR Command and Housekeeping Data Interface (S1-IF-AAE-SC-0001), [RD.04], common to the

three Sentinels corresponds to the decimal value of the most significant byte of the SID format and ranges between 213 and 235. The range corresponds to D500 Hex and EB00 Hex. Hence the SID CAT field correspond to decimal 13 and 14.

8.7 SID ASSIGNMENT FOR NON-REAL TIME HK TM

The following SID are dedicated for non-real time TM(3,25) with PCAT = 8:

4096 dec (1000 Hex)
4097 dec (1001 Hex)
4098 dec (1002 hex)

9 SERVICE PARAMETER DEFINITIONS

The physical format of the parameter field in a packet is deduced from the value(s) of one or several preceding parameter fields in the packet (including the packet type and subtype). It can additionally depend on the application process and on the service provided by the application process.

Unless where specified, the physical format of a parameter field is unique for the mission. The parameter field can appear in different packet types and subtypes

The encoding of a parameter field is identical in all packet types and subtypes sent to or generated by the application process.

All fields are of type Unsigned Integer (UI), i.e. PTC = 3, unless otherwise specified. The specified type is indicated in column 'Type', where:

- B = Boolean (PTC = 1)
- E = Enumerated (PTC = 2)
- UI = Unsigned Integer (PTC = 3)
- SI = Signed Integer (PTC = 4)
- FP = Floating Point (PTC = 5)
- BS = Bit-String (PTC = 6)
- OS = Octet String (PTC = 7)
- AT = Absolute Time (PTC = 9)
- RT = Relative Time (PTC = 10)
- D = Deduced

9.1 SERVICE 1 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Telecommand Packet ID	1 word	UI	This is a copy of the corresponding fields from the packet header of the telecommand to which this verification packet relates (i.e. Word 1 of the TC Packet Header)	TM(1,1) TM(1,2) TM(1,3) TM(1,4) TM(1,5) TM(1,6) TM(1,7) TM(1,8)	
Packet Sequence Control	1 word	UI	This is a copy of the corresponding fields from the packet header of the telecommand to which this verification packet relates (i.e. Word 2 of TC Packet	TM(1,1) TM(1,2) TM(1,3) TM(1,4) TM(1,5) TM(1,6) TM(1,7) TM(1,8)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			Header)		
Code	1 word	E	<p>The code indicates the reason for the failure of the telecommand at this verification stage.</p> <p>At the acceptance stage, the following standard code values are defined:</p> <p>0 = illegal APID (PAC error); 1 = incomplete or invalid length packet; 2 = incorrect checksum; 3 = illegal packet type; 4 = illegal packet subtype; 5 = illegal or inconsistent application data.</p> <p>Other values of the code are application process specific or command specific (i.e. dependent on combinations of the type, subtype and individual command function). The code is an identifier for the auxiliary information provided with this report, i.e. the parameters field.</p>	TM(1,2) TM(1,4) TM(1,6) TM(1,8)	
Complementary Information	variable	D	<p>Complementary information relating to the particular value of the code field. For full interpretation of failure of a command, knowledge of the nature of the command must be available.</p>	TM(1,2) TM(1,4) TM(1,6) TM(1,8)	
Step Number	1 word	UI	<p>This indicates the intermediate step number of the telecommand execution profile whose execution has been completed. The values it can take are telecommand-specific.</p>	TM(1,5) TM(1,6)	

9.2 SERVICE 2 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Length of CPDU TC Packet-1	1 byte	UI	Specifies the length of the CPDU TC packet-1 embedded in the TC(2,144).	TC(2,144)	
Length of CPDU TC Packet-2	1 byte	UI	Specifies the length of the CPDU TC packet-2 embedded in the TC(2,144). When equal to zero indicates that only one CPDU TC packet is present in TC(2,144)	TC(2,144)	
CPDU TC Packet-1	variable	OS	Complete CPDU TC packet format as shown in Figure 3.3-1.	TC(2,144)	
CPDU TC Packet-2	variable	OS	Complete CPDU TC packet format as shown in Figure 3.3-1.	TC(2,144)	

9.3 SERVICE 3 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
SID	1 word	E	The structure identification which corresponds to this reporting definition.	TC(3,1) TC(3,2) TC(3,3) TC(3,4) TC(3,5) TC(3,6) TC(3,7) TC(3,8) TC(3,9) TM(3,10) TC(3,11) TM(3,12) TM(3,25) TM(3,26) TC(3,128) TC(3,129) TM(3,131) TM(3,133) TM(3,144) TM(3,145) TC(3,240) TC(3,241)	
Collection Interval	1 word	E	The data collection interval for the housekeeping or diagnostic parameter report definition.	TC(3,1) TC(3,2) TM(3,10) TM(3,12) TC(3,128) TC(3,129) TM(3,131) TM(3,133) TM(3,144) TM(3,145)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Collection Offset	1 word	E	Specifies the position in the TM cycle at which a telemetry report will be generated.	TC(3,1) TC(3,2) TM(3,10) TM(3,12) TC(3,128) TC(3,129) TM(3,131) TM(3,133) TM(3,144) TM(3,145)	
NPAR1	1 word	UI	The number of parameters in the definition that are sampled once per collection interval.	TC(3,1) TC(3,2) TM(3,10) TM(3,12)	
Parameter #	2 words	UI	The parameter number to be sampled. A "parameter number" is used onboard, for optimisation purposes. It has a unique correspondence with the "Parameter ID" which is used on the ground for identification purposes.	TC(3,1) TC(3,2) TM(3,10) TM(3,12)	
NFA	1 word	UI	The number of fixed-length arrays.	TM(3,10) TM(3,12)	
NREP	1 byte	UI	The number of values to be sampled for each parameter within this fixed length array.	TM(3,10) TM(3,12)	
NPAR2	1 byte	UI	The number of different parameters within this fixed-length array, each of which shall be sampled "NREP" times per collection interval.	TM(3,10) TM(3,12)	
NSID	1 word	UI	Identifies the number of Report Definitions that are contained in the telemetry packet.	TM(3,131) TM(3,133) TM(3,144) TM(3,145)	
Status	1 word	E	Identifies whether the generation of the Housekeeping or Diagnostic Report identified by the SID is enabled or disabled.	TM(3,131) TM(3,133) TM(3,144) TM(3,145)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(3,10) TM(3,12) TM(3,144) TM(3,145)	
Report Integrity Counter	15 bit	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(3,10) TM(3,12) TM(3,144) TM(3,145)	
Collection Interval	1 word	UI	Generation period for the HK / Diagnostic TM packet expressed in number of cycles.	TC(3,240) TC(3,241)	

9.4 SERVICE 4 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Reset Flag	1 word	E	This indicates whether the evaluation of the parameter statistics must be reset or not. Its values are "No" (value=0) and "Yes" (value=1).	TC(4,1)	
Tstart	3 words	AT	The time at which the evaluation of the parameter statistics started (i.e. the last time the parameter statistics list was reset).	TM(4,2)	
NPAR	1 word	UI	The number of parameters in the parameter statistics list which have been sampled at least once since the list was last reset.	TM(4,2) TC(4,6) TC(4,7) TM(4,9) TC(4,144) TC(4,145) TM(4,146) TC(4,161) TM(4,162)	
Parameter#	2 words	UI	The identification of a parameter.	TM(4,2) TC(4,6) TC(4,7) TM(4,9) TC(4,144) TM(4,146) TC(4,161)	
Maxval	2 words	UI	The maximum value of the corresponding parameter number.	TM(4,2)	
Tmax	3 words	AT	The time at which the maximum value was attained.	TM(4,2)	
Minval	2 words	UI	The minimum value of the corresponding parameter number.	TM(4,2)	
Tmin	3 words	AT	The time at which the minimum value was attained.	TM(4,2)	
Meanval	2 words	UI	The mean value of the corresponding parameter number.	TM(4,2)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(4,2) TM(4,9) TM(4,146) TM(4,162)	
Report Integrity Counter	15 bit	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(4,2) TM(4,9) TM(4,146) TM(4,162)	
Sampling Interval	1 word	E	The sampling interval to use for the associated parameter.	TC(4,6) TC(4,144)	
ICM Sampling Interval	1 byte	E	Specifies the frequency with which the value of the associated	TC(4,161) TM(4,162)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			parameter will be acquired for the statistical calculation.		
Acquisition Slice	1 byte	E	Identifies a position in the TM Frame cycle. The cycle is of 32 seconds duration. Each second is divided into 8 slices. The Acquisition Slice is expressed in the format [second,slice] and specifies the point in the TM Frame cycle at which a telemetry value is specified.	TC(4,161) TM(4,162)	
Statistics Table Offset	1 word	E	Index of the parameter in the Parameter Statistics List table.	TC(4,144) TC(4,145) TM(4,146)	
Data Format	1 word	E	Specifies the parameter type and format	TC(4,144) TM(4,146)	

9.5 SERVICE 5 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
RID	1 word	E	The Report ID (RID), together with the application process ID, implicitly defines the presence, structure and interpretation of the associated parameters field.	TM(5,1) TM(5,2) TM(5,3) TM(5,4) TC(5,5) TC(5,6) TM(5,130)	
Complimentary Information	variable	D	Complementary information relating to the particular value of the report ID.	TM(5,1) TM(5,2) TM(5,3) TM(5,4)	
NRID	1 word	UI	The number of RID that follow.	TC(5,5) TC(5,6) TM(5,130)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(5,130)	
Report Integrity Counter	15 bit	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(5,130)	

9.6 SERVICE 6 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Memory ID	1 word	E	The Memory ID identifies the destination memory block	TC(6,1) TC(6,2) TC(6,3) TC(6,5) TM(6,6) TC(6,9) TM(6,10) TM(6,145)	
N	1 word	UI	The number of data blocks to be loaded.	TC(6,1) TC(6,2) TC(6,3) TC(6,5) TC(6,146)	
Base ID	2 words	UI	The Base ID is a base reference which gives the address within the memory block which is used as the zero reference for the offset addresses.	TC(6,1) TC(6,3) TM(6,144)	
Offset	1 word	UI	Specifies the offset from the base reference of the start address for loading / reading the data which follows.	TC(6,1) TC(6,3) TM(6,144)	
Length	1 word	UI	The number of data units to be loaded or of data that follows.	TC(6,1) TC(6,2) TM(6,6) TM(6,145)	
Data	variable	OS	A data block to be loaded or of data that follows.	TC(6,1) TC(6,2) TM(6,6) TM(6,145) TC(6,146) TM(6,148)	
Start Address	2 words	UI	Gives the start address in memory for loading the data or of the data that follows.	TC(6,2) TC(6,5) TM(6,6) TC(6,9) TM(6,10) TM(6,144) TM(6,145) TC(6,161) TC(6,162)	
Length_6_3	2 words	UI	The number of data units to be dumped.	TC(6,3)	
Length_6_5	2 words	UI	The number of data units to be dumped	TC(6,5)	
Length_6_9	2 words	UI	The number of data units to be dumped / that follows.	TC(6,9) TM(6,10)	
Length_6_161	2 words	UI	The number of data units to be dumped. The value must be a multiple of 4.	TC(6,161) TC(6,162)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a	TM(6,6) TM(6,145) TM(6,148)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.		
Report Integrity Counter	15 bit	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(6,6) TM(6,145) TM(6,148)	
Checksum	1 word	UI	The value obtained by computing the ISO standard 16-bit checksum over the relevant memory locations.	TM(6,10)	
TAG ID	2 word	UI	TAG identifier of the Parameter in the TM Data Pool	TC(6,146) TC(6,147)	
Length of Parameter	1 word	UI	Size of parameter.	TC(6,146)	
Data Length	2 words	UI	The length of the Data dumped corresponding to the logical parameter identified by the TAG ID.	TM(6,148)	
Local / Partner	1 byte	E	Indicates which of the two redundant HW modules to be used: 0 => local 1 => partner 2 => not relevant (i.e. don't care)	TC(6,149) TC(6,150) TM(6,151)	
Register ID	1 word	E	SMU HW Register set identifier: 10 H => ACARO registers 20 H => ERC32 registers 30 H => HPC2 register 40 H => RM registers 50 H => SpaceWire registers 60 H => TCM registers 70 - 71 H => TME registers 80 - 89 H => OBRT registers	TC(6,149) TC(6,150) TM(6,151)	
Register Address	2 words	UI	Address of the Register to dump.	TC(6,150)	
Destination Address	2 words	UI	An Address in memory expressed in SAU. The	TC(6,161) TC(6,162)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			memory address values must be a multiple of 4.		
OAS ROM Address	2 words	UI	Indicates the address of the OAS image in the EEPROM	TC(6,241)	
Memory Page ID	1 word	E	Identification Number of the active user memory page	TC(6,242)	
Source Memory ID	1 word	E	Identification of LCT TAPCO memory from which the data must be copied	TC(6,240)	
Source Start Address	2 words	UI	Start Address of the memory source for copying the data	TC(6,240)	
Destination Memory ID	1 word	E	Identification of LCT TAPCO memory to which the data must be loaded	TC(6,240)	
Destination Start Address	2 words	UI	Start Address of the memory destination for loading the data	TC(6,240)	
Length of Data Block	1 word	UI	Length in bytes (in SAU) of the data block to be copied	TC(6,240)	

9.7 SERVICE 8 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Sync Phase	1 word	E	Delay to be applied between TCU PSYNC input signal and TPSU 1 Sync output signal.	TC(8,221)	TCU TC to update Power Sync Phase Control Register
EFE HK Acquisition Cycle	1 word	E	Parameter controlling the frequency of HKM acquisition from the EFEs.	TC(8,222)	TCU TC to update RABCF Parametes
EFE Temp Comp Delta T	1 word	E	Change of TRM temperature which forces calculation of new compensated TRM settings and subsequent issue of corresponding CCMs to the EFEs.	TC(8,222)	
EFE Temp Comp Timeout	1 word	E	Number of PRIs without sending a CCM of type 2 or type 3, which – when exceeded – forces calculation of new compensated TRM	TC(8,222)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			settings and subsequent issue of corresponding CCMs to the EFEs		
Function ID	1 word	E	Identification number of the function to be activated	TC(8,1)	
Parameter 1/2	1 word	UI	Parameter relating to the function to be performed.	TC(8,1)	

9.8 SERVICE 9 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Delta OBT	3 words	RT	The value to be set in the SW variable Delta OBT to be added to the hardware counter. It can only set seconds and not sub-seconds.	TC(9,144)	
Sign	1 bit	E	Indicates if to be added or subtracted.	TC(9,145)	
Time Offset	3 words	RT	The time value in whole seconds to be added or subtracted to the SW variable Delta OBT.	TC(9,145)	
New Onboard Time	2 words	AT	The two most significant words of the Onboard Time i.e. the number of whole seconds.	TC(9,129)	
ICM PPS Sync Time	3 words	AT	The value of the Onboard Time recorded at the occurrence of the last PPS signal but prior to the adjustment of the Onboard Time value. This allows the drift of the ICM clock vs the external PPS.	TM(9,160)	
DSHA PPS Sync Time	3 words	AT	The value of the Onboard Time recorded at the occurrence of the last PPS signal but prior to the adjustment of the Onboard Time value. This allows the drift of the DSHA clock vs the external PPS. The resolution of the PDHT time field in TM(9,224) is 3.96 ms which is the same as the Time Stamp field of TM packets.	TM(9,224)	
TCM Current Time	3 words	AT	The current Onboard Time of the TCM module.	TM(9,160)	
RxM H Current Time	3 words	AT	The current Onboard Time of the RxM-H module.	TM(9,160)	
RxM V Current Time	3 words	AT	The current Onboard Time of the RxM-V module.	TM(9,160)	

9.9 SERVICE 11 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
N1	1 word	UI	Number of records that follow.	TC(11,1) TC(11,2) TC(11,6) TC(11,144) TC(11,8) TC(11,145) TM(11,19)	
Sub-Schedule ID	11 bits	E	Identifies a set of TC which have been linked by Ground by assigning the same Sub-Schedule identifier for operational convenience. Setting Subshedule ID to 0 for TC(11,1), TC(11,2) and TC(11,6) means all SSID.	TC(11,1) TC(11,2) TC(11,4) TC(11,6) TC(11,8) TM(11,10) TM(11,13) TM(11,19)	
N° of TC Packets	5 bits	UI	Number of TC packets in TC(11,4)	TC(11,4)	
N2	1 word	UI	The number records that follow.	TC(11,1) TC(11,2) TM(11,19)	
PID	7 bits	E	Identifies the destination process.	TC(11,1) TC(11,2) TC(11,5) TC(11,144) TC(11,7) TC(11,145) TC(11,16) TM(11,19)	
N	1 word	UI	The number of records that follow.	TC(11,5) TM(11,13)	
Sequence Count	14 bits	UI	Specifies the sequence count of the first telecommand packet in the Time Tag Schedule with the specified PID which is to be deleted or time-shifted or dumped. The (PID, Sequence Count) pair uniquely identifies a telecommand packet.	TC(11,5) TC(11,7) TC(11,16)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Number of Telecommands	1 word	UI	The number of successive telecommand packets in the Time Tag Schedule from the specified telecommand packet which are to be deleted or time-shifted.	TC(11,5) TC(11,7)	
Range	1 word	E	Indicates the time interval where: 0 => All - from the beginning to the end of the command schedule. 1 => Between - between Time Tag 1 and Time Tag 2 inclusive 2 => Before - less than or equal to Time Tag 1. 3 => After - greater than or equal to Time Tag 1.	TC(11,6) TC(11,144) TC(11,8) TC(11,145)	
Time Tag 1	3 words	AT	The earliest absolute time if Range is "Between" or "After". The latest absolute time if Range is "Before". This parameter is not used (i.e. don't care) if Range is "All". The Time Tag 1 format is as per Figure 3.5-2.	TC(11,6) TC(11,144) TC(11,8) TC(11,145)	
Time Tag 2	3 words	AT	The latest absolute time if Range is "Between". This parameter is not used (i.e. don't care) if Range is either "All", "Before" or "After". The Time Tag 2 format is as per Figure 3.5-2.	TC(11,6) TC(11,144) TC(11,8) TC(11,145)	
Time Offset	3 words	RT	Specifies the delta time for the requested time-shift operation. The Time Offset format is as per Figure 3.5-2.	TC(11,7) TC(11,8) TC(11,145) TC(11,15)	
Sign of Time Offset	1 word	E	Specifies if the Time Offset is positive or negative. 0 => Plus : the Time-Tag of the selected TT-TC are shifted forward. 1 => Negative : the Time-Tag of the selected TT-TC are shifted backwards.	TC(11,7) TC(11,8) TC(11,145) TC(11,15)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(11,10) TM(11,13) TM(11,19)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(11,10) TM(11,13) TM(11,19)	
Time Tag	3 words	AT	Execution time of the TC in TT-TC Schedule	TM(11,13)	
TC Packet Header	3 words	OS	TC Packet Header of the TC in TT-TC Schedule.	TM(11,13)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
TC Packet Data Field Header	2 words	OS	TC Packet Data Field of the TC in TT-TC Schedule	TM(11,13)	
Status	1 bit	E	Enable / disable status.	TM(11,19)	

9.10 SERVICE 12 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
N_12_1	1 word	UI	The number of parameters whose monitoring must be enabled or disabled. By convention, N = 0 means "enable/disable monitoring at service level". If N_12_1 > 0, each parameter in the request must be processed in turn and its parameter level monitoring status must be set to "enabled" or "disabled, depending on the request subtype.	TC(12,1) TC(12,2)	
NPAR	1 word	UI	The number of parameters to be added to the monitoring list.	TC(12,225) TC(12,227) TM(12,229)	
N_12_6	1 word	UI	The number of parameters to be deleted from the monitoring list.	TC(12,6)	
N_12_9	1 word	UI	The number of Parameter ID and associated checks specified in the telemetry packet.	TM(12,162)	
N_12_11	1 word	UI	The number of Out-of-Limit Parameter ID checks that are contained in the telemetry packet.	TM(12,11)	
N_12_7	1 word	UI	The number of Parameter ID included in the telecommand.	TC(12,163)	
N	1 word	UI	The number of monitoring items contained in the telecommand or telemetry packet.	TC(12,7) TM(12,9) TC(12,144) TC(12,161) TM(12,155)	
N1	1 word	UI	The number of MDS contained in the telemetry packet.	TM(12,153)	
N2	1 word	UI	The number of monitoring items belonging to the MDS that are out-of-limit.	TM(12,153)	
Parameter #	2 words	UI	The identification of a parameter.	TC(12,1) TC(12,2) TC(12,225) TC(12,6) TC(12,7) TM(12,9)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
				TM(12,11) TM(12,155) TM(12,229)	
Parameter Monitoring Interval	1 byte	E	The interval between performing monitoring checks on the associated parameters.	TM(12,9) TC(12,161) TM(12,162)	
Parameter Monitoring Status	1 word	E	Indicates the monitoring status of the corresponding Parameter.	TM(12,9) TM(12,162) TM(12,229)	
Acquisition Slice	1 byte	E	Identifies a position in the TM Frame cycle. The cycle is of 32 seconds duration. Each second is divided into 8 slices. The AcquisitionSlice is expressed in the format (second,slice) and specifies the point in the TM Frame cycle at which a telemetry value is acquired.	TC(12,161) TM(12,162)	
Recovery Action	1 bit	E	Indicates if a recovery action is to be performed.	TC(12,225) TM(12,229)	
OOL Number	4 bits	UI	Out-Of-Limit Number defines the number of times an out-of-limit has to occur before starting the related recovery action.	TC(12,225) TC(12,227) TM(12,229)	
NOL	1 word	UI	The number of limit-check definitions.	TC(12,225) TC(12,7) TM(12,9) TC(12,161) TM(12,162) TC(12,163) TC(12,227) TM(12,229)	
NOE	1 word	UI	The number of expected-value-check definitions.	TC(12,225) TC(12,7) TM(12,9) TC(12,161) TM(12,162) TC(12,163) TC(12,227) TM(12,229)	
Low Limit	2 words	UI	The type and format of the Low Limit must be the same as the type and format of the parameter to be monitored.	TC(12,225) TC(12,7) TM(12,9) TC(12,161) TM(12,162) TC(12,163) TC(12,227) TM(12,229)	
High Limit	2 words	UI	The type and format of the High Limit must be the same as the type and format of the parameter to be monitored	TC(12,225) TC(12,7) TM(12,9) TC(12,161) TM(12,162) TC(12,163) TC(12,227) TM(12,229)	
Expected Value	2 words	UI	Expected value with which the actual value of the parameter is compared.	TC(12,225) TC(12,7) TM(12,9) TC(12,161) TM(12,162) TC(12,163) TC(12,227) TM(12,229)	
RID	1 word	E	The identifier of the event report to be generated in the event of a monitoring violation.	TC(12,225) TC(12,7) TM(12,9) TC(12,161) TM(12,162) TC(12,163)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			By convention, the value 0 for RID means "no event report is generated".	TC(12,227) TM(12,229)	
Check Position	1 byte	E	<p>This indicates which check definition (for the given parameter) is deleted, added or replaced with a new check definition.</p> <p>A positive Check Position value indicates that the corresponding check definition for the parameter must be replaced by the new check definition which follows.</p> <p>A negative Check Position value indicates that the corresponding check definition in the positive range must be deleted (the positions of succeeding check definitions are decremented). No check definition must follow in this case. The service must refuse to delete the last remaining check definition of a parameter and must report the error.</p> <p>If the Check Position value is 0, this indicates that the check definition which follows should be added to the monitoring list.</p>	TC(12,7) TM(12,9)	
ICM Check Position	1 word	SI	<p>Defines whether check definition(s) must be replaced or deleted for the associated Parameter.</p> <p>A positive value indicates that the Check Definition(s) are to be defined for the Modes in accordance with the associated Check Selection parameter.</p> <p>A negative value indicates that the Check Definition(s) must be removed for the Modes corresponding to the associated Check Selection parameter. The last Check Definition for a Parameter cannot be removed.</p>	TC(12,163)	
Check Selection	1 byte	E	An array of bit flags, each bit representing the Mode in which the associated parameter check is applied.	TC(12,7) TM(12,9)	
ICM Check Selection #	1 word	E	This parameter is an array of bit flags, each bit representing the Mode in which the associated parameter check must be applied.	TC(12,161) TM(12,162) TC(12,163)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided	TM(12,9) TM(12,11) TM(12,162) TM(12,153) TM(12,155) TM(12,229)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			by the Report Integrity Counter.		
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(12,9) TM(12,11) TM(12,162) TM(12,153) TM(12,155) TM(12,229)	
Monitoring Status	1 byte	E	This indicates whether the overall monitoring is "enabled" or "disabled".	TM(12,9) TM(12,162) TM(12,229)	
Maximum Reporting Delay	1 byte	E	The maximum reporting delay between a check transition occurring and the associated report (12,12) being made. It is not applicable to SES as (12,12) is not supported. Hence set to a fixed value of 0.	TM(12,9) TM(12,162)	
Parameter Value	2 words	UI	The parameter value of the Parameter #. A fixed 32-bit format. When the parameter size is less than 32-bits (e.g. 3-bits) the parameter value is reported in the least significant bits.	TM(12,11)	
Limit Crossed	2 words	UI	This is the value of the Low Limit, High Limit or Expected Value which has been crossed or violated. It has the same format and length as the value of the parameter itself. Hence a fixed 32-bit format. When the Limit Crossed size is less than 32-bits (e.g. 3-bits) the Limit Crossed value is reported in the least significant bits.	TM(12,11)	
Previous Checking Status	1 byte	E	This indicates the checking status of the parameter before the transition to the current checking status. The possible values are: 0: Expected Value, Within Limits, Within Threshold 1: Unchecked 2: Invalid 3: unselected 4: Unexpected Value, Below Low Limit, Below Low Threshold. 5: Above High Limit, Above High Threshold.	TM(12,11)	
Current Checking Status	1 byte	E	This indicates the current checking status of the parameter. The possible values are as per Previous Checking Status.	TM(12,11)	
Transition Time	3 words	AT	The time at which the transition occurred, i.e. the time of the first sample used to elaborate the current checking status.	TM(12,11)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
MDS ID	1 byte	UI	Identifier of the Monitoring Data Set (MDS)	TC (12,144) TC(12,145) TC(12,148) TC(12,149) TC(12,151) TC(12,152) TC(12,154) TM(12,153) TM(12,155)	
Monitoring ID	1 byte	UI	Identifier of the monitoring item,	TC(12,144) TC(12,145) TC(12,152) TM(12,153) TM(12,155)	
Out-of-Limit Status	1 byte	E	Specifies the limit that has been exceeded.	TM(12,153)	
EN-DIS Status	4 bits	E	Enable/disable status of monitoring item.	TC(12,144) TC(12,145) TM(12,155)	
Repeat Flag	4 bits	E	Controls whether the confirmed out-of-range event is triggered continuously or only re-triggered after a back-in-limit event.	TC(12,144) TM(12,155)	
TAG ID	2 words	UI	TAG identifier of the Parameter in the TM Data Pool	TC(12,144)	
Validity Parameter 1	2 words	UI	TAG ID of the first Validity Parameter.	TC(12,144) TM(12,155)	
Validity Parameter 2	2 words	UI	TAG ID of the second Validity Parameter	TC(12,144) TM(12,155)	
Data Type	1 byte	E	Type of the parameter to be monitored.	TC(12,144) TM(12,155)	
HK Filter	1 byte	UI	Number of out-of-range consecutive samples for event signalling.	TC(12,144) TM(12,155)	
Low Threshold	2 words	UI	Low Threshold of the Validity Range.	TC(12,144) TM(12,155)	
High Threshold	2 words	UI	High Threshold of the Validity Range.	TC(12,144) TM(12,155)	
Event Handler 1	1 word	UI	Identifier of the event triggered in case of confirmed out-of-range low.	TC(12,144) TM(12,155)	
Event Handler 2	1 word	UI	Identifier of the event triggered in case of confirmed out-of-range high.	TC(12,144) TM(12,155)	
Event Handler 3	1 word	UI	Identifier of the event triggered in case of back-in-limit.	TC(12,144) TM(12,155)	
MDS TC Option	1 bit	E	Specifies whether TC(12,148)/TC(12,149 act on MDS Disable/Enable Status or on the MDS Suspend/Resume Status. 0 => Disable/Enable MDS 1 => Suspend/Resume MDS (the Suspend state has a configurable time-out period)	TC(12,148) TC(12,149)	

9.11 SERVICE 14 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
PID	7 bits	E	Identifies the destination process.	TC(14,1) TC(14,2) TM(14,4)	
N2	1 word	UI	The number of specified Types of the PID. When N2=0 indicates all Types and associated Subtypes of the PID.	TC(14,1) TC(14,2) TM(14,4) TC(14,144) TC(14,145) TM(14,146) TC(14,147) TC(14,148) TM(14,149)	
N3	1 word	UI	The number of specified Subtypes of the Type of the PID. When N3=0 indicates all Subtypes of the Type of the PID.	TC(14,1) TC(14,2)	
Type	1 byte	E	PUS Service Type.	TC(14,1) TC(14,2) TM(14,4)	
Subtype	1 byte	E	Subtype of the PUS Service Type.	TC(14,1) TC(14,2) TM(14,4)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(14,4)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(14,4)	
SID	1 word	E	The unique structure identification associated to a housekeeping or diagnostic parameter report.	TC(14,144) TC(14,145) TM(14,146) TC(14,147) TC(14,148) TM(14,149)	

9.12 SERVICE 15 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
N	1 word	UI	The number of packet stores to be controlled or reported. By convention, N = 0 means "all packet stores".	TC(15,1) TC(15,2) TC(15,11) TC(15,12) TC(15,129) TC(15,144) TC(15,146) TC(15,147) TM(15,224) TC(15,225) TC(228)	
Store ID	1 word	E	A packet store is uniquely identified by a "Store ID".	TC(15,1) TC(15,2) TC(15,3) TC(15,4) TC(15,5) TM(15,6) TC(15,9) TC(15,11) TC(15,11) TC(15,128) TC(15,129) TC(15,144) TC(15,146) TC(15,147) TC(15,149) TM(15,224) TC(15,225) TC(15,226) TC(15,227) TC(15,228) TC(15,233) TC(15,234)	
Store ID H-Polarisation	1 word	UI	Specifies the Packet Store where the pass-through H-Polarisation is performed.	TC(15,229)	
Store ID V-Polarisation	1 word	UI	Specifies the Packet Store where the pass-through H-Polarisation is performed	TC(15,229)	
PID	7 bits	E	The identification of the application process which is addressed by the TC or which has generated the TM packet.	TC(15,3) TC(15,4) TM(15,6)	
N2	1 word	UI	The number of specified Types of the PID. When N2=0 indicates all Types and associated Subtypes of the PID.	TC(15,3) TC(15,4) TM(15,6)	
N3	1 word	UI	The number of specified Subtypes of the Type of the PID. When N3=0 indicates all Subtypes of the Type of the PID.	TC(15,3) TC(15,4) TM(15,6)	
Type	1 byte	E	PUS Service Type.	TC(15,3) TC(15,4) TM(15,6)	
Subtype	1 byte	E	Subtype of the PUS Service Type.	TC(15,3) TC(15,4) TM(15,6)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(15,6) TM(15,224)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(15,6) TM(15,224)	
Time Span	1 word	E	Type of Packet Range. It can be: 0 => All (Full contents of the Packet Store); 1=> Between (Set of packets whose storage time are between Storage Time 1 and Storage Time 2 inclusive); 2 => Before (Set of packets whose storage time are less then or equal to Storage Time 1); 3 => After (Set of packets whose storage time are greater then or equal to Storage Time 1)	TC(15,9)	
Storage Time 1	3 words	AT	The absolute time defining the lower boundary of the range of packets for downlink. Storage Time 1 is not used (i.e. is don't care) when Time Span is set to "All". Storage Time 1 format is as per Figure 3.5-2.	TC(15,9) TC(15,149)	
Storage Time 2	3 words	AT	The absolute time defining the upper boundary of the range of packets for downlink. Storage Time 2 is only used when Time Span is set to "Between". Storage Time 2 format is as per Figure 3.5-2.	TC(15,9) TC(15,149)	
APID 1	11 bits	E	Specified TM Packet 1 APID	TC(15,149)	
Source Sequence Count 1	14 bits	UI	Specified TM Packet 1 Source Sequence Count	TC(15,149)	
APID 2	11 bits	E	Specified TM Packet 2 APID	TC(15,149)	
Source Sequence Count 2	14 bits	UI	Specified TM Packet 2 Source Sequence Count	TC(15,149)	
End Time	3 words	AT	The absolute time defining the upper boundary (inclusive) of the packet range to be deleted. End Time format is as per Figure 3.5-2.	TC(15,11)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Time	3 words	AT	The absolute time defining the storage time from where the next read operation will start. Time parameter format is as per Figure 3.5-2.	TC(15,128)	
Mode	1 word	E	The Packet Store mode of operation.	TC(15,144)	
Size	2 words	UI	SMU Packet Store size.	TC(15,144)	
Free Sector Count	1 word	UI	Number of Sectors (4 MB) available for storage.	TM(15,224)	
Overwriting Mode	1 bit	E	Specifies whether in overwrite mode or not.	TM(15,224)	
Packet Store Type	1 bit	E	Reports the PS Type: Bounded or Circular	TM(15,224) TC(15,226)	
Virtual Channel ID	6 bits	E	Reports the PS associated Virtual Channel	TM(15,224) TC(15,226)	
EN-DIS Status	1 bit	E	Reports the PS enable/disable status	TM(15,224)	
OK-NOK Status	1 bit	E	Reports the OK-NOK status of PS in terms of correctness of data content	TM(15,224)	
Start Pointer	1 word	UI	Absolute logical addresses expressed as number of sectors (4 MB).	TM(15,224)	
Write Pointer	1 word	UI	Absolute logical addresses expressed as number of sectors (4 MB).	TM(15,224)	
Read Pointer	1 word	UI	Absolute logical addresses expressed as number of sectors (4 MB).	TM(15,224)	
PS Size	1 word	UI	Reports PS filled memory area expressed in sectors (4 MB)	TM(15,224)	
Max Size	1 word	UI	Reports the maximum number of sectors that the Packet Store is allowed to contain. A minimum size of 3 sectors is required.	TC(15,226)	
SAR Redundancy	1 bit	E	Identifies SES will transmit data, main or redundant.	TC(15,227) TC(15,229)	
SDI Within Time-Out Flag	1 bit	E	Establishes whether to use the default value or the value specified in the telecommand for the time-out value between successive source packets.	TC(15,227) TC(15,229)	
SDI Initial Time-Out Flag	1 bit	E	Establishes whether to use the default value or the value specified in the telecommand for the time-out value for the first source packet of the Data Take.	TC(15,227) TC(15,229)	
Enable Store V-Polarization	1 bit	E	Specifies whether to perform or not the store of SAR Data V-	TC(15,227)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			Polarisation.		
Enable Store H-Polarization	1 bit	E	Specifies whether to perform or not the store of SAR Data H-Polarisation.	TC(15,227)	
Initial Time Out Value	1 word	UI	Initial Time Out value to be used when the "SDI Initial Time-Out Flag" is set to "New Value". The Initial Time Out Value is the time-out for the first source packet of a Data Take.	TC(15,227) TC(15,229)	
Within Time Out Value	1 word	UI	Within Time Out value to be used when the "SDI Within Time-Out Flag" is set to "New Value". The Within Time Out Value is the time-out between successive source packets of a Data Take.	TC(15,227) TC(15,229)	
Number of Sectors	1 word	UI	Specifies the total number of sectors (4MB) to be downlinked	TC(15,228)	
SIGN Fill Data	7 bits	UI	Reserved. Set to zero.	TC(15,228) TC(15,230)	
SIGN Fill Data H-Polarisation	7 bits	UI	Reserved. Set to zero.	TC(15,229)	
SIGN Fill Data V-Polarisation	7 bits	UI	Reserved. Set to zero.	TC(15,229)	
Carrier Selection	1 bit	E	Downlink carrier selection. L1 or L2.	TC(15,228) TC(15,230)	
Carrier Selection H-Polarisation	1 bit	E	Downlink carrier selection for pass-through H-Polarisation. L1 or L2.	TC(15,229)	
Carrier Selection V-Polarisation	1 bit	E	Downlink carrier selection for pass-through V-Polarisation. L1 or L2.	TC(15,229)	
Data Strategy	1 bit	E	Selects if to retain or delete data after downlink of the Packet Store.	TC(15,228)	
Data Strategy H-Polarisation	1 bit	E	Selects if to retain or delete data after downlink H-Polarisation.	TC(15,229)	
Data Strategy V-Polarisation	1 bit	E	Selects if to retain or delete data after downlink V-Polarisation	TC(15,229)	
Read Pointer Setting	1 bit	E	Specifies if to enable or disable the setting of the Read Pointer to the last sector downlinked	TC(15,228)	
Enable Pass Through V-Polarisation	1 bit	E	Specifies whether to perform or not the pass-through of V-Polarisation	TC(15,229)	
Enable Pass Through H-Polarisation	1 bit	E	Specifies whether to perform or not the pass-through of H-Polarisation	TC(15,229)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Pass Through Delay V-Polarisation	1 word	E	Specifies the delay before pass-through V-Polarisation start. Delay defined in steps of 125 ms. Max delay is 12 minutes.	TC(15,229)	
Pass Through Delay H-Polarisation	1 word	E	Specifies the delay before pass-through H-Polarisation start. Delay defined in steps of 125 ms. Max delay is 12 minutes	TC(15,229)	
Pass Through Time Duration V-Polarisation	1 word	E	Specifies the time to be considered for downlink phase of pass-through V-Polarisation. Time defined at 125 ms steps. Max time is 20 minutes.	TC(15,229)	
Pass Through Time Duration H-Polarisation	1 word	E	Specifies the time to be considered for downlink phase of pass-through H-Polarisation. Time defined at 125 ms steps. Max time is 20 minutes.	TC(15,229)	
Overwriting BITE	1 bit	E	Specifies whether to perform BITE with overwriting data or not.	TC(15,230)	
Memory Module On/Off Switch	1 bit	E	Specifies whether to perform BITE with or without selection of the Memory Module.	TC(15,230)	
Memory Module Selection	3 bit	E	Specifies the Memory Module to perform BITE.	TC(15,230)	
BITE Filler Word	1 word	UI	Provides the 16-bits data sequence to be cyclically stored in one memory module for the data downlink.	TC(15,230)	
Test Abort	1 bit	E	Specifies whether to continue or abort an on-going memory module test.	TC(15,232)	
BITE Abort	1 bit	E	Specifies whether to continue or abort an on-going BITE.	TC(15,232)	
SAR Data Store Abort V-Pol	1 bit	E	Specifies whether to continue or abort an on-going Store from SAR V-Polarisation.	TC(15,232)	
SAR Data Store Abort H-Pol	1 bit	E	Specifies whether to continue or abort an on-going Store from SAR H-Polarisation	TC(15,232)	
L2 Downlink Abort	1 bit	E	Specifies whether to continue or abort an on-going L2 downlink	TC(15,232)	
L1 Downlink Abort	1 bit	E	Specifies whether to continue or abort an on-going L1 downlink	TC(15,232)	
Pass Through Abort V-Pol	1 bit	E	Specifies whether to continue or abort an on-going V-Polarisation pass-through	TC(15,232)	
Pass Through Abort H-Pol	1 bit	E	Specifies whether to continue or abort an on-going H-Polarisation pass-through	TC(15,232)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Sectors Shift	2 words	E	Specifies the position to move the Read Pointer. It can be moved back a specified number of sectors or moved to the first sector of the non deleted sectors (0000 value) or forward to the last sector stored (FFFF value) i.e. to the Write Pointer sector.	TC(15,233)	

9.13 SERVICE 18 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
OBOP ID	2 words	E	Identifies an Onboard Operation Procedure (OBOP). Note: The OBOP ID is applicable to both the ASW and ICM. ICM supports only 32 OBOP and OBOP ID value also assigns a priority where the lower numbers have a higher priority. The ASW has structured the OBOP ID into two sub-fields Section ID and Procedure ID to indicate the storage area. Hence S1 Specific PUS refers only to the generic OBOP ID applicable to ICM and ASW.	TC(18,144) TC(18,160) TC(18,2) TC(18,3) TC(18,4) TM(18,146) TC(18,130) TC(18,147) TC(18,148) TM(18,164) TM(18,163) TM(18,11)	
Commands in OBOP	1 word	UI	Total commands in OBOP.	TC(18,144)	
Command Offset	1 word	UI	First command in OBOP to be modified.	TC(18,144)	
N	1 word	UI	Number of commands to Add/Modify in the OBOP	TC(18,144)	
OBCD Command ID	2 words	E	Identifier of the command in the OnBoard Command Data Base	TC(18,144)	
Time Delay	2 words	UI	Time delay before the scheduling and execution of the command of the OBOP. It is defined as number of 125 ms increments.	TC(18,144)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Execution Delay	1 byte	UI	Defines the time delay in 125 ms increments before executing the associated telecommand in the active OBOP. A value of zero will be interpreted as no delay.	TC(18,160) TM(18,164)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(18,146) TM(18,163) TM(18,164) TM(18,11)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(18,146) TM(18,163) TM(18,164) TM(18,11)	
NPROC	1 word	UI	Number of OBOP	TM(18,146) TTC(18,147) TC(18,148) TM(18,11)	
Status	1 word	E	Enable / disable status of OBOP	TM(18,146)	
Current Step ID	1 byte	UI	Gives the current Procedure Step of an OBOP that is either Suspended or Executing. A value of zero indicates that the OBOP is either undefined or inactive.	TM(18,163)	
OBOP (i) Status	1 byte	E	Gives the current status of an Onboard Operation Procedure as stored within the SES OBOP Database (where i = 0..31). The OBOP has a priority assigned based on its ID number where a lower number equals a higher priority i.e. 0 = highest; 255 = lowest. SES supports a maximum of 32 OBOPs.	TM(18,163)	
NSTEPS	1 word	UI	The number of OBOP Procedure Steps (comprising the Step number, Execution Delay, TC Packet and Packet Word count) defined in the telemetry packet.	TM(18,164)	
Step ID	1 byte	UI	Specifies the Procedure Step number in the associated OBOP at which the telecommand defined within the current telecommand packet will be inserted	TC(18,160) TM(18,164)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
No. of TC Packet Words	1 word	UI	Number of TC Packet words contained in the telemetry packet	TM(18,164) TC(18,160)	
Step	1 word	UI	OBOP command step	TM(18,11)	
Parameter #	2 words	UI	The identification of a parameter.	TC(18,149)	
Low Limit	2 words	UI	Low limit value	TC(18,149)	
High Limit	2 words	UI	High limit value.	TC(18,149)	
Data Type	1 word	E	Type of the parameter to be checked.	TC(18,149)	
Step Offset	1 word	SI	Number of OBOP Step to be jumped.	TC(18,149)	

9.14 SERVICE 19 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
N	1 word	UI	The number of RID contained in the telecommand or the number of Event Detections listed in the telemetry report.	TC(19,1) TC(19,2) TC(19,4) TC(19,5) TM(19,7) TC(19,160)	
RID	1 word	E	The Report ID identifies a specific event report.	TC(19,1) TC(19,2) TC(19,4) TC(19,5) TM(19,7) TC(19,128) TM(19,129) TC(19,160)	
TC Packet	variable	OS	Complete TC packet	TC(19,1) TC(19,160)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(19,7) TM(19,129) TM(19,149) TM(19,151) TM(19,153) TM(19,155)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(19,7) TM(19,129) TM(19,149) TM(19,151) TM(19,153) TM(19,155)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Action Status	1 word	E	Indicates whether an Event Action associated with a RID is enabled or disabled.	TM(19,7)	
N° of TC Packet Words	1 word	UI	Provides the number of words contained of the TC packet which in TM(19,129) can be part of a TC packet whereas in TC(19,160) is a complete TC packet.	TM(19,129) TC(19,160)	
First RID	1 word	E	First RID to be modified.	TC(19,144) TC(19,146) TC(19,147) TM(19,149) TM(19,151) TM(19,153) TM(19,155)	
First Event	1 word	E	First Event to be modified.	TC(19,145)	
N Records	1 word	UI	Number of RID-Event Table elements	TC(19,144) TC(19,145) TC(19,146) TC(19,147) TM(19,149) TM(19,151) TM(19,153) TM(19,155)	
OK Event ID	1 word	E	Defines the format of the items that links the RID to the OK Event identifier.	TC(19,144) TM(19,149)	
NOK Event ID	1 word	E	Defines the format of the items that links the RID to the NOK Event identifier.	TC(19,144) TM(19,149)	
RID Status	1 byte	E	Enable / Disable Status of RID.	TC(19,145) TM(19,151)	
Last OK/NOK Condition	1 byte	E	Status of the last occurrence of the RID where the last occurrence can be OK (within limits) or NOK (out-of-limits).	TC(19,145) TM(19,151)	
RECO 1 Filter	1 byte	E	Confirmation threshold for the first level of recovery	TC(19,146) TM(19,153)	
RECO 2 Filter	1 byte	E	Confirmation threshold for the second level of recovery	TC(19,146) TM(19,153)	
RECO 3 Filter	1 byte	E	Confirmation threshold for the third level of recovery	TC(19,146) TM(19,153)	
Event Handler Enable /Disable	1 bit	E	Event handler enable / disable.	TC(19,146) TM(19,153)	
Recovery Action Enable /Disable	1 bit	E	Recovery action enable / disable.	TC(19,146) TM(19,153)	
Telemetry Enable /Disable	1 bit	E	Telemetry enable / disable.	TC(19,146) TM(19,153)	
Suspend MDS RECO 1	1 bit	E	Flag to suspend MDS after first level of recovery.	TC(19,146) TM(19,153)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Disable Monitoring RECO 1	1 bit	E	Flag to disable Monitoring after first level recovery.	TC(19,146) TM(19,153)	
Suspend MDS RECO 2	1 bit	E	Flag to suspend MDS after second level of recovery.	TC(19,146) TM(19,153)	
Disable Monitoring RECO 2	1 bit	E	Flag to disable Monitoring after second level recovery.	TC(19,146) TM(19,153)	
Suspend MDS RECO 3	1 bit	E	Flag to suspend MDS after third level of recovery.	TC(19,146) TM(19,153)	
Disable Monitoring RECO 3	1 bit	E	Flag to disable Monitoring after third level recovery.	TC(19,146) TM(19,153)	
RECO 1 Type	2 bits	E	Specifies the first level recovery executor where it can be an OBCD telecommand, OBCP or Ada Coded procedure	TC(19,146) TM(19,153)	
RECO 2 Type	2 bits	E	Specifies the second level recovery executor where it can be an OBCD telecommand, OBCP or Ada Coded procedure	TC(19,146) TM(19,153)	
RECO 3 Type	2 bits	E	Specifies the third level recovery executor where it can be an OBCD telecommand, OBCP or Ada Coded procedure	TC(19,146) TM(19,153)	
RECO 1 ID	2 words	E	Identifier of the Recovery Action for the first level recovery.	TC(19,146) TM(19,153)	
RECO 2 ID	2 words	E	Identifier of the Recovery Action for the second level recovery	TC(19,146) TM(19,153)	
RECO 3 ID	2 words	E	Identifier of the Recovery Action for the third level recovery	TC(19,146) TM(19,153)	
Fail Mark Data	2 words	E	Identifies where the Fail Hardware Channel information has to be stored. It is identified by a Tag ID.	TC(19,146) TM(19,153)	
Fail Mark Level	1 word	E	Level of recovery when the "Failed Hardware Channel" has to be set. It can be: 0 => the condition has not to be set 1-3 => level of recovery	TC(19,146) TM(19,153)	
Status of Event-Action Entry	1 word	E	Enable / disable status of the Event Action Table entry.	TC(19,147)	
Event E/D Status	1 byte	E	Event enable / disable status.	TM(19,155)	
Action E/D Status	1 byte	E	Action enable / disable status.	TM(19,155)	

9.15 SERVICE 130 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Section ID	1 word	E	Section ID identifies one of the two spare sections of the On Board Command Database (OBCD)	TC(130,1) TC(130,5) TM(130,6) TC(130,7) TC(130,8) TC(130,9) TC(130,10)	
Command ID	1 word	E	Command ID uniquely identifies the TC in the Section ID	TC(130,1) TC(130,5) TM(130,6) TC(130,7) TC(130,8) TC(130,9) TC(130,10)	
Free Memory	1 word	UI	Size in 16 bit words of the free space in the spare section of the OBCD.	TM(130,4)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(130,6)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(130,6)	
N° of TC Packet Words	1 word	UI	Number of words of the TC Packet of the OBCD being dumped contained in the telemetry packet	TM(130,6)	

9.16 SERVICE 131 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Orbit Number	1 word	UI	The on board orbit number "n" to be set and updated on-board as a continuous unsigned 16-bit counter providing more than 11 years wrap-around.	TC(131,1) TM(131,3)	

9.17 SERVICE 132 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
N1	1 word	UI	Number of records that follow.	TC(132,1) TC(132,2) TC(132,6) TC(132,144) TM(132,19)	
Sub-Schedule ID	11-bits	E	Identifies a set of TC which have been linked by Ground by assigning the same Sub-Schedule identifier (SSID) for operational convenience. Setting Subshedule ID to 0 for TC(132,1), TC(132,2) and TC(132,6) means all SSID.	TC(132,1) TC(132,2) TC(132,6) TM(132,10) TM(132,13) TM(132,19)	
N2	1 word	UI	The number records that follow.	TC(132,1) TC(132,2) TM(132,19)	
PID	7 bits	E	Identifies the destination process.	TC(132,1) TC(132,2) TC(132,5) TC(132,144) TC(132,16) TM(132,19)	
N	1 word	UI	The number of records that follow.	TC(132,5) TM(132,13)	
Packet Sequence Count	14 bits	UI	Specifies the sequence count of the first telecommand packet in the Position Tag Schedule with the specified PID which is to be deleted or dumped.	TC(132,5) TC(132,16)	
Number of Telecommands	1 word	UI	The number of successive telecommand packets in the Position Tag Schedule from the specified telecommand packet which are to be deleted.	TC(132,5)	
Range	1 word	E	Indicates the position interval where:	TC(132,6) TC(132,144)	

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
			0 => All - from the beginning to the end of the command schedule. 1 => Between – between Position Tag 1 and Position Tag 2 inclusive 2 => Before - less than or equal to Position Tag 1 3 => After - greater than or equal to Position Tag 1		
Position Tag 1	3 words	Fig. 3.6-2	Position Tag 1 which is used when Range specifies “Between”, “Before” or “After”. It is not used (i.e. don’t care) when Range specifies “All”. The Position Tag 1 format is as per Figure 3.6-2.	TC(132,6) TC(132,144)	
Position Tag 2	3 words	Fig. 3.6-2	Position Tag 2 which is only used when Range specifies “Between”. It is not used (i.e. don’t care) when Range specifies “All”, “Before” or “After”. The Position Tag 2 format is as per Figure 3.6-2.	TC(132,6) TC(132,144)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(132,10) TM(132,13) TM(132,19)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(132,10) TM(132,13) TM(132,19)	
Position Tag	3 words	Fig. 3.6-2	The Position Tag value of the TC Packet being reported either in detailed form or summary form. The Position Tag format is as per Figure 3.6-2.	TM(132,10) TM(132,13)	
N° of TC Packet Words	1 word	UI	Number of words of the TC Packet contained in the telemetry report	TM(132,10)	
TC Packet Header	3 words	OS	TC Packet Header of the TC in PT-TC Schedule.	TM(132,13)	
TC Packet Data Field Header	2 words	OS	TC Packet Data Field of the TC in PT-TC Schedule	TM(132,13)	
Status	1 bit	E	Enable / disable status.	TM(132,19)	

9.18 SERVICE 133 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
Arm TC Packet	variable	OS	The TC contained in TC(133,1) to be "Armed" onboard and only executed on reception of the corresponding TC(133,5) Fire TC.	TC(133,1)	
Last Packet	1 bit	E	Indicates when the last packet has been reached in the telemetry report which could be composed of a sequence of multiple packets. The sequence order of the telemetry packets is provided by the Report Integrity Counter.	TM(133,3)	
Report Integrity Counter	15 bits	UI	Provides the sequence order of the telemetry packets composing a telemetry report. The last packet of the sequence is provided by the Last Packet field.	TM(133,3)	
N° of TC Packet Words	1 word	UI	Number of words of the Arm TC Packet which are contained in the telemetry report	TM(133,3)	
Arm TC Packet Words	variable	OS	Part or the complete Arm TC packet which is contained in the telemetry report	TM(133,3)	
Arm TC Packet Header	3 words	OS	TC Packet Header of the Arm TC	TC(133,5)	
Arm TC Packet Data Field Header	2 words	OS	TC Packet Data Field of the Arm TC	TC(133,5)	

9.19 SERVICE 134 PARAMETERS

PARAMETER	SIZE	TYPE	DESCRIPTION	USED BY	REMARKS
N° of TC Packets (P)	1 word	UI	The number of TC Packets contained in the TC	TC(134,1)	
TC Packet-P	variable	OS	One of the TC Packets contained in TC(134,1)	TC(134,1)	

DISTRIBUTION LIST

Name	Q.ty	Name	Q.ty
M. Masci	1	ESA	1
G. Campolo	1	ASTRIUM	1
