## 5. LIBRARY INSTALLATION

For a detailed description of the installation of any CFI library, please refer to [GEN\_SUM].

## 6. LIBRARY USAGE

Note that to use the EO\_DATA\_HANDLING software library, the following other CFI software libraries are required:

- EO\_FILE\_HANDLING (See [F\_H\_SUM]).

It is needed to have properly installed in the system the following external libraries:

- LIBXML2 (MIT license, see [GEN\_SUM]), and the
- POSIX thread library: libpthread.so (pthread.lib for WINDOWS, with license LGPL)

To use the EO\_DATA\_HANDLING software library in a user application, that application must include in its source code:

- explorer\_data\_handling.h (for a C application)

To link correctly this application, the user must include in his linking command flags like (assuming *cfl\_include\_dir* and *cfl\_lib\_dir* are the directories where respectively all CFI libraries and include files have been installed, see [GEN\_SUM] for installation procedures):

- SOLARIS/LINUX:

```
-Icfl_include_dir -Lcfl_lib_dir -lexplorer_data_handling
-lexplorer_file_handling -lxmll2 -lpthread
```

- WINDOWS:

```
/I "cfl_include_dir" /libpath:"cfl_lib_dir" libexplorer_data_handling.lib
libexplorer_file_handling.lib libxml2.lib pthread.lib
```

- MacOS:

```
-Icfl_include_dir -Lcfl_lib_dir -lexplorer_data_handling
-lexplorer_file_handling -lpthread
-framework libxml -framework libiconv
```

All functions described in this document have a name starting with the prefix *xd\_*

To avoid problems in linking a user application with the EO\_DATA\_HANDLING software library due to the existence of names multiple defined, the user application should avoid naming any global software item beginning with either the prefix *XD\_* or *xd\_*.

Finally, in order to use the function **xd\_xml\_validate** or its equivalent executable program **xml\_validator**, it is necessary the xerces-c 2.7 (or later) dynamic library and the SAX2Count executable program. Both of them are distributed under Apache 2.0 Licence (More information about xerces-c can be found in: <http://xml.apache.org/xerces-c/index.html>).

Both, **xd\_xml\_validate** and **xml\_validator** internally calls the SAX2Count program, so that in order to find it, the path for SAX2Count and the xerces-c dynamic library has to be included in the environment variable PATH (For LINUX and SOLARIS, the xerces library has to be included in the LD\_LIBRARY\_PATH instead).

It is possible to call the following CFI functions from a user application.

Notes about the table:

- To transform the extended status flag returned by a CFI function to either a list of error codes or a list of error messages, the enumeration value (or the corresponding long value) described in the table must be used
- The error handling functions have no enumerated values

Whenever available it is strongly recommended to use enumeration values rather than integer values.

## 6.1. Usage hints

Every CFI function has a different length of the Error Vector, used in the calling I/F examples of this SUM and defined at the beginning of the library header file. In order to provide the user with a single value that could be used as Error Vector length for every function, a generic value has been defined (XD\_ERR\_VECTOR\_MAX\_LENGTH) as the maximum of all the Error Vector lengths. This value can therefore be safely used for every call of functions of this library.

## 6.2. General Enumerations

The aim of the current section is to present the enumeration values that can be used rather than integer parameters for some of the input parameters of the EO\_DATA\_HANDLING routines, as shown in the table below. The enumerations presented in [GEN\_SUM] are also applicable.

### 7.46.5. Warnings and errors

Next table lists the possible error messages that can be returned by the `xd_write_tle` CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library `xd_get_msg` (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the `xd_write_tle` function by calling the function of the EO\_DATA\_HANDLING software library `xd_get_code` (see [GEN\_SUM])

## 7.47.xd\_xml\_validate

### 7.47.1.Overview

The **xd\_xml\_validate** CFI function validates an XML file using its XML schema and checks the XML schema versioning.

### 7.47.2.Calling interface

The calling interface of the CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
    long status, valid_status;
    char *filename, *schema, *logfile;
    long mode;
    long ierr[XD_NUM_ERR_XML_VALIDATE];

    status = xd_xml_validate (filename, &mode, schema, logfile,
                           &valid_status, ierr);
}
```

### 7.47.3.Input parameters

## 7.47.6. Runtime performances

The following runtime performances have been measured.

*Table 145: Runtime performances of xd\_xml\_validate function*

### 7.47.7. Executable program

An XML file can also be validated using the executable program **xml\_validate**. It can be called from a Unix shell as:

```
xml_validate -file filename  
[-sch schema_filename] [-log log_filename]  
[-help] [-v]  
[-show]
```

Note that:

- Order of parameters does not matter.
- Bracketed parameters are not mandatory.
- [-v] option for Verbose mode (default is Silent).
- [-show] displays the inputs of the function and the results.
- The filename is validated using the schema\_filename if it is provided. If not, the default schema is used (the one in the root element of the file).
- The validation log is stored in the log\_filename. By default the standard output is used.

Example:

```
xml_validate -file ../../data/CRYOSAT_XML_OSF  
-sch ../../schemas/public/CS_OPER_MPL_ORBSCT_01.00.XSD  
-log log_file_exe -show
```

## 8. LIST OF SCHEMA'S VERSIONS

Next table shows the available schema's versions for the Earth Observation Missions files at the time of the CFI's package delivery, and which of them are supported by the current CFI's implementation.

The meaning of the column “Supp. CFI's” is:

- ◆ N: Version not supported for reading/writing.
- ◆ Y: Supported version for reading and writing.
- ◆ R: Supported only for reading.

Note that the writing functions create files with the version labeled with “Y”.

For consulting the format of these files in their last version see section 9. For older versions, the format can be consulted through the schema.

In the CFI's installation packages schemas and example files are included (under *files* directory, see [GEN\_SUM]).

## 9. FILES FORMAT SPECIFICATION

This section presents the formats for all the files used by the Earth Observation CFI software. These formats correspond to the last schema versions indicated in section 8.

The files used by the CFI can be:

- External: Files generated and/or used for the CFI software and other external facilities.
- Internal: Files used only in the CFI for configuration purposes.

All internal files are written in ASCII, with XML syntax. Following the usual format for the Earth Observation Files, the file contains both:

- A header: It is divided in a fixed header and optionally a variable header. The format for the fixed header is common to all Earth Observation Files and can be seen in [EE\_FMT].
- A data block containing the input/output data of the functions.
- The general structure for a file will be:

```
<?xml version = "1.0" encoding = "UTF-8"?>
<Earth_Explorer_File>
  <Earth_Explorer_Header>
    <Fixed_Header>
      ...
    </Fixed_Header>
    <Variable_Header>
      ...
    </Variable_Header>
  </Earth_Explorer_Header>

  <Data_Block type="xml">
    ...
  </Data_Block type>

</Earth_Explorer_File>
```

### 9.1.Fixed Header

#### 9.1.1.Format

The Fixed Header is an XML structure. Many of its fields are redundant with the File Name elements, but are present in more readable form in the Fixed Header, whereas in File Name they are more compact for obvious reasons. Its format is described in the followig tables:

**Table 147: Fixed Header Structure**

Tag name	type	Attribute	C Format	Description
File_Name	string	-	%s	It is a repetition of the Logical File Name, i.e. the File Names excluding the extension. This allows this field to be independent from the storage in 1 complete file or 2 separate files for Header and Data Block
File_Description	string	-	%s	A 1-line description of the File Type. Each Mission shall define the list of official file descriptions (per File Type).
Notes	string	-	%s	Multi-lines free text. This can be used for any type of comment, relevant that instance of the file.
Mission	string	-	%s	A 1-word description of the Mission, coherent with the Mission element in the File Name. See [EE_FMT] Section 4.1.1 for the official list.
File_Class	string	-	%10s	A 1-line description of the file class, coherent with the File Class element in the File Name. Each Mission shall define the list of official file classes.
File_Type	string	-	%s	It is a repetition of the File Type element in the File Name.
Validity_Period	structure (see Table 148)	-	-	Structure containing the start-stop validity period of the file.
File_Version	integer	-	%04d	It is a repetition of the File Version element in the File Name. Must start at 1 (not 0).
Source	structure (see Table 149)	-	-	Structure with information about the source of the file.

**Table 148: Fixed Header. Validity Period**

Tag name	type	Attribute	C Format	Description
Validity_Start	%23s	-	string	This is the UTC Validity Start Time, coherent with the Validity Start Time in the File Name, but in CCSDS ASCII format with time reference. Note that this can have the special value indicating "beginning of mission" (without an absolute time specified) as defined in [MCD]

Validity_Stop	%23s	-	string	<p>This is the UTC Validity Stop Time, coherent with the Validity Stop Time in the File Name, but in CCSDS ASCII format with time reference.</p> <p>Note that this can have the special value indicating “end of mission” (without an absolute time specified) as defined in [MCD].</p>
---------------	------	---	--------	---

**Table 149: Fixed Header. Source**

Tag name	type	Attribute	C Format	Description
System	string	-	%s	Name of the Ground Segment element creating the file (e.g. FOS, PDS, SSALTO...)
Creator	string	-	%s	Name of the tool, within the Ground Segment element, creating the file (e.g. CS-MCS, IPF1...)
Creator_Version	string	-	%s	Version of the tool (e.g. 1.0, 2.1a ...)
Creation_Date	string	-	%23s	This is the UTC Creation Date, in CCSDS ASCII format with time reference. This format is defined in [MCD].
